HP Virtual Connect and Networking for BladeSystem

January 2014

Wire-once simplicity

HP Virtual Connect simplifies and converges your server edge connections, making server changes transparent to storage and networks, and delivering four times the number of connections per physical network link. Virtual connect enables you to dynamically optimize and control bandwidth using fewer physical ports for the same performance, while reducing server edge infrastructure (switches, host bus adapters [HBAs], network interface cards [NICs], and cables) up to 95 percent and hardware costs up to 65 percent, in turn saving power up to 40 percent. HP Virtual Connect FlexFabric connects servers and virtual machines to data and storage networks over Ethernet, Fibre Channel, and iSCSI protocols. With more than 8.5 million ports shipped, Virtual Connect continues to deliver proven simplified operations.

Virtual Connect

HP Virtual Connect FlexFabric

10 Gb/24-port Module

As the simplest, most flexible way to connect virtualized server blades to data or storage networks, HP Virtual Connect FlexFabric 10 Gb/24-port Modules eliminate up to 95 percent^{1,2} of network sprawl at the server edge—using one device that converges traffic inside enclosures and directly connects to external LANs and SANs. Utilizing Flex-10 technology with Fibre Channel over Ethernet and accelerated iSCSI, these modules converge traffic over high-speed 10 Gb connections to servers with HP FlexFabric Adapters (HP NC551i or HP NC551m Dual Port FlexFabric 10 Gb Converged Network Adapters or HP NC553i 10 Gb 2-port FlexFabric Converged Network Adapter). Each redundant pair of VC FlexFabric modules provides eight adjustable downlink connections (six Ethernet and two Fibre Channel, or six Ethernet and two iSCSI, or eight Ethernet) to dual port 10 Gb FlexFabric Adapters on servers. Up to eight uplinks are available for connection to upstream Ethernet and Fibre Channel switches. Virtual Connect FlexFabric modules avoid the confusion of traditional and other converged network solutions by eliminating the need for multiple Ethernet and Fibre Channel switches, extension modules, cables, and software licenses. Also, Virtual Connect wire-once connection management is built-in, enabling server adds, moves, and replacements in minutes instead of days or weeks.

FlexFabric bridges the convergence gap between server and network with single-hop and dual-hop to provide maximum flexibility. The single-hop brings convergence to servers without changing existing LAN and SAN. Dual-hop brings convergence from server to aggregation layer.

^{1,2} HP internal calculations comparing the number of hardware components of traditional infrastructure vs. HP BladeSystem with two Virtual Connect FlexFabric modules, June 2013.

Easy operations and deployment

- Server blades are change-ready—you can add, move, replace, or upgrade server blades, as well as move workloads without affecting your LAN and SAN.
- You can wire once, and then add, move, and change network connections in minutes instead of days. You can also manage connections to thousands of servers from a single pane-of-glass.
- HP Virtual Connect modules simplify your network by providing one module for all your data and storage connection needs with both single-hop and dual-hop. Single-hop enables converged fabric at server end without impacting traditional LAN and SAN. Dual-hop bridges gap between converged fabric at server end and aggregation layer.
- HP Virtual Connect modules are compatible with existing data and storage networks, protocols, and procedures, as well as with all other standards-based switch products. VC modules provide high-performance and end-to-end optical or copper connections with HP Networking or other brands of aggregation or core switches.
- HP Virtual Connect modules are edge-safe. Any changes to the server are transparent to its associated network. This clearly separates the server blades from your LAN/SAN and relieves LAN/SAN administrators from server maintenance.
- FlexFabric adapters support hypervisor best practice configurations, with six HP FlexNIC and two HP FlexHBA standard connections on each adapter.
- HP VC FlexFabric 10 Gb/24-port Module supports FlatSAN solution with direct attach to Fibre Channel (FC) storage with HP 3PAR StoreServ Storage Systems, which removes the need for SAN fabric between servers and HP 3PAR Storage Arrays—resulting in operational simplicity and reduced total cost of ownership (TCO) in connecting to FC storage in a virtualized environment.
- HP VC FlexFabric 10 Gb/24-port Module supports both single-hop and dual-hop.
- HP VC Flex-10/10D Module supports dual-hop only.

Enterprise-class performance and availability

- Requires up to 95 percent¹ fewer network cards, switches, and cables to buy, install, qualify, and maintain; helps significantly reduce power, cooling, and equipment costs with HP Virtual Connect Converged Networking
- Most efficient use of your network by using only the capacity you need
- Increases uptime with high-availability features such as NIC teaming, trunk failover, and dual redundant Virtual Connect FlexFabric modules
- Provides direct uplink connections to LAN and SAN, unlike other solutions that reroute SAN traffic to the LAN
- Builds in standards-based data center connectivity through port-based VLANs, VLAN tagging, Internet Group Management Protocol (IGMP) Snooping, N_Port ID Virtualization (NPIV), and uplink port aggregation with up to 1,000 VLANs per shared uplink set
- Fine-tunes the performance of each data and storage connection to meet the needs of each virtual machine and workload

HP Virtual Connect Flex 10/10D Module

An innovative, new class of integrated interconnects, the HP Virtual Connect Flex-10/10D Module for c-Class BladeSystem simplifies your data center and makes it change-ready. The simplest, most flexible connection to your networks, the Virtual Connect Flex-10/10D Modules:

- Simplifies server connections by cleanly separating the server enclosure from the LAN
- Simplifies networks by reducing cables without adding switches to manage
- Allows you to change servers in just minutes, not days
- Tailors network connections and speeds based on application needs
- Bridges convergence fabric gap between server and network with dual-hop feature

HP Flex-10 technology significantly reduces infrastructure costs by increasing the number of NICs per connection without adding extra blade I/O modules, and reducing cabling uplinks to the data center network.

Security and management

- Virtual Connect Manager (VCM) Web-based console is embedded in each VC FlexFabric and Converged Networking/Ethernet module. You can define available LANs, SANs, and server connections, as well as manage server connection profiles for individual BladeSystem enclosures.
- The latest VC firmware now supports both SNMP v1 and SNMP v2 traps; traps for key predefined threshold conditions; and per-destination configuration of traps.
- Additional role-based privileges for user accounts can be created by domain, server, networking, and storage administrators.
- Multi-enclosure stacking enables all of the VC modules (up to four connected enclosures) to function as a single VC domain.

HP Virtual Connect Ethernet

Ease of operations and deployment

- You can preconfigure the enclosures for easy, drop-in server installations, either locally or remotely.
- Server blades are change-ready—you can add, move, replace, or upgrade server blades, as well as move workloads, without affecting your LAN.
- The standards-based HP VC Ethernet modules are compatible with all other standards-based Ethernet switch products. These modules provide high-performance, end-to-end optical, or copper connections with HP Networking or other brands of core switches.
- HP VC Ethernet modules appear as pass-thru devices to the network. Any changes to the server are transparent to its associated network. This clearly separates the server blades from your LAN and relieves LAN administrators from server maintenance.

Enterprise-class performance and availability

- Choices of 1 Gb to 10 Gb downlink connections to server-embedded and mezzanine NICs and CNAs; up to 200 Gb full-duplex uplink bandwidth through 1/10 Gb and 2/4/8 Gb Fibre Channel uplinks for providing non-blocking bandwidth to data center networks.
- Standards-based data center connectivity is built in, using features such as port-based virtual LANs (VLANs), VLAN tagging, IGMP Snooping, NPV, and uplink port aggregation with up to 1,000 VLANs per shared uplink set.
- VC server profiles are shared and continually updated between high-availability pairs.

Security and management

- Embedded VCM Web-based console runs on either VC Ethernet or FlexFabric modules. You can define available LANs and server connections, as well as manage server connection profiles for individual BladeSystem enclosures.
- The latest VC firmware now supports both SNMP v1 and SNMP v2 traps; traps for key predefined threshold conditions; and per-destination configuration of traps.
- Role-based privileges for the administrator account are defined by default; they can be modified by the server administrator and integrated with Lightweight Directory Access Protocol (LDAP) servers.
- For networking environments that have implemented TACACS+ and RADIUS protocols for security, VC supports these protocols in addition to LDAP.
- Additional role-based privileges for user accounts can be created by domain, server blade, networking, and storage.
- Multi-enclosure stacking enables all of the VC modules (up to four connected enclosures) to function as a single VC domain.

HP Virtual Connect Fibre Channel

HP Virtual Connect 8 Gb/24-port Fibre Channel Module

Look to the Virtual Connect 8 Gb/24-port Fibre Channel for the highest port density in the Virtual Connect Fibre Channel line-up. This standards-based module is compatible with all other NPIV standards-based switch products—enabling high-performance and end-to-end connections with your available options of core switches.

The 8 Gb Fibre Channel interconnect enables greater performance and server consolidation. Eight SAN-facing ports and 16 server ports help reduce oversubscription for high-throughput applications. In addition, separate storage resources are available for each virtual machine—up to 255 per server blade.

HP Virtual Connect 8 Gb/20-port Fibre Channel Module

Simplify and make your data center change-ready with the HP Virtual Connect 8 Gb/20-port Fibre Channel Module for BladeSystem c-Class. As the next-generation successor to the current HP 4 Gb Virtual Connect Fibre Channel Module, the HP Virtual Connect 8 Gb/20-port FC module offers enhanced support for server-side NPIV and Virtual Connect capabilities—allowing up to 128 virtual machines to run on the same physical server to access separate storage resources.

Provisioned storage resources are associated directly to a specific virtual machine—even if the virtual server is re-allocated within the BladeSystem. Storage management of virtual machines is no longer limited by the single physical HBA on a server blade. SAN administrators can now manage virtual HBAs with the same methods and viewpoint of physical HBAs.

The HP Virtual Connect 8 Gb/20-port Fibre Channel Module for the BladeSystem c-Class is the simplest, most flexible connection to your SAN fabrics. The module simplifies server connections by cleanly separating the server enclosure from SAN, simplifies SAN fabrics by reducing cables without adding switches to the domain, and allows you to change servers in just minutes, not days.

Ease of operations and deployment

- With NPIV and HP Virtual Connect Fibre Channel technology, storage management is no longer limited to a single HBA World Wide Name (WWN) on the physical server. NPIV provides the ability to share a single physical Fibre Channel HBA port among multiple virtual ports, each with its own unique identifiers—allowing control of virtual machine access to LUNs on per virtual machine basis.
- The standards-based HP Virtual Connect Fibre Channel Module interoperates with other SAN switch products. NPIV allows you to scale, gaining immediate benefits without having to add domain IDs. Consider a blade server environment, such as an HP BladeSystem c7000 chassis that has Fibre Channel switches in the back of the chassis. By using NPIV, you can add these switches to your fabric without assigning a domain ID to each one—resulting in high-performance end-to-end connections with your available options of core switches.

Enterprise-class performance and availability

- Storage resources can be provisioned and associated directly to a specific virtual machine in a virtualized server environment.
- High-availability features such as dual modules and automatic fail over provide increased uptime.
- VC server blade profiles are shared and continually updated between high availability pairs.
- Enhanced NPIV capability supports multiple virtual machines per server blade and provides a separate storage resource to each virtual machine—up to 128 per server blade.

Introducing HP OneView

Next-generation infrastructure management designed for the way you work and think

HP OneView is a fresh approach to converged infrastructure management, inspired by the way you expect to work, with a single integrated view of your IT infrastructure. By shifting the focus from “how devices run” to “how people work,” HP OneView architecture delivers unprecedented ease of use that lets you deploy and manage your infrastructure faster, at a lower cost, and at virtually any scale.

HP OneView provides:

- A single, collaborative management platform built for speed. It allows IT teams to work and collaborate in a more natural and automated way.
- Software-based approach to lifecycle management, which automates operations to reduce the cost and time to deliver IT services.
- An open development platform designed to rapidly adapt to your business needs. This programmable platform, built on the REST API, allows you to scale beyond your data center walls to the cloud.

Transform the way you manage your IT infrastructure—today

Consumer-inspired management experience

- Reduce risk—and deployment and management time—with a modern architecture-based, single management platform for HP BladeSystem environments
- Simplify everyday management tasks—no matter how large or complex the environment—with an intuitive user interface
- Get a comprehensive view of all infrastructure resources with the intuitive dashboard
- Quickly find what you’re looking for in your environment and act on it with Smart Search
- See the relationships between every device—for fast troubleshooting and resolution—using Map View

Software-defined lifecycle management

- Instantly deliver resources without mistakes or variation with configuration profiles for push-button builds
- Boost productivity and consistency—workflow templates capture best-practices and policies
- Automate common BladeSystem management tasks thanks to built-in intelligence

Open, extensible platform

- Easily customize workflows and scripts with fully programmable interface
- Architecture builds on the open REST API, the way modern Web-based architectures and applications are designed today
- Work faster—integration with other applications, processes, and devices is done in minutes versus hours

Ethernet blade switches

Simplify your network with our complete portfolio of Ethernet blade switches

HP is redefining the data center. We started with the BladeSystem c-Class—a simple, modular infrastructure designed to save your time, energy, and money, regardless of what you put inside. To be efficient, a data center must be able to access and disseminate data instantaneously, securely, and reliably. This is where the HP portfolio of Ethernet switching products can make a difference.

HP BladeSystem c-Class switches provide a rich set of networking features and can lower the cost of maintenance and operation, as well as increase network reliability by sharing the same redundant power and cooling resources with the server blades, while also aggregating cables and reducing wiring clutter.

An Ethernet switch for every application

Whether you need basic network connectivity for a remote office or a high-bandwidth, low-latency link for a high-performance computing cluster, HP Ethernet switches provide the solution. You can choose from simple-to-configure 1 Gb switches, 1 Gb/10 Gb hybrid switches designed especially for data centers in transition, or a powerful 10/40 Gb switch designed for handling data from today's multiprocessor virtualized servers.

If your data center has an ever-increasing appetite for bandwidth, look to HP for help. When coupled with our high-performance server blades and mezzanine cards, HP Ethernet switches can also support iSCSI and converged fabric standards—all from a single network connection. These protocols are designed to move data more efficiently and with less overhead than standard methods. Redefining the data center and simplifying your job—as well as offering greater value, reliability, connectivity, and scalability—is what the HP Ethernet Blade Switch portfolio is all about.

HP 6125 Blade Switch series

Introducing the next-generation Ethernet blade switches from HP Networking. Designed from the ground up with the latest switching technology, and configured with processing power and memory usually reserved for higher-density rack switches, the HP 6125 Switch series brings a new level of network access to the c-Class enclosure.

HP 6125 Switch series run on Comware, a common operating system for blade, top-of-rack aggregation, and core Ethernet switches from HP Networking. The use of a common OS means that today's demanding data centers can be managed and configured from edge-to-edge under a single stream of firmware using common configuration scripts, troubleshooting procedures, and upgrade policies. HP 6125 Switches can be combined into a single virtual switch with the HP Intelligent Resilient Framework (IRF).

All HP 6125 Switch series provide Layer 3 routing and are IPv6 compatible. And similar to all other HP Networking switches, the HP 6125 Switch series can be managed through the HP Intelligent Management Center (IMC). HP IMC is next-generation management software that provides the data center operations team with a comprehensive single pane-of-glass management platform that integrates network technologies and provides full fault tolerance, configuration, accounting, performance, and security management functionality.

The new HP 6125XLG Blade Switch

As the next generation blade switching technology for data center environments, the HP 6125XLG Ethernet Blade Switch delivers a feature-rich, high-performance, and low-latency 10/40GbE switch. HP 6125XLG provides a converged fabric solution that supports Ethernet, and Fibre Channel over Ethernet (FCoE) protocols to enable connectivity for FCoE storage solutions. In addition, HP 6125XLG supports advanced features such as DCB, VEPA, TRILL, and full Layer 3 routing.

HP 6125XLG is ideal for blade customers requiring 10/40GbE connectivity to top-of-rack or aggregation switches for data center environments.

Mellanox SX1018HP Ethernet Switch

This extensive portfolio now includes the world's fastest Ethernet Blade Switch from HP. Another industry first, the Mellanox SX1018HP Ethernet Switch provides the lowest port-to-port latency of any blade switch—more than four times faster than previous switches. HP is the first to provide 40 Gb downlinks to each blade server, enabling InfiniBand-like performance in an Ethernet Blade Switch. When combined with the space, power, and cooling benefits of blade servers, the Mellanox SX1018HP Ethernet Switch provides the perfect network interface for financial applications and high-performance clusters.

The Mellanox SX1018HP Ethernet Switch is the highest-performing Ethernet fabric solution in a blade switch form factor. The switch delivers up to 1.36 Tb/s of non-blocking throughput to support high-performance computing, high-frequency trading, and enterprise data center applications.

Utilizing the latest Mellanox SwitchX ASIC technology, the SX1018HP is an ultra-low latency switch suited as an access switch with 16 10 Gb/40 Gb server side downlinks and 18 40 Gb QSFP+ uplinks to the core, with port-to-port latency as low as 220 ns.

The Mellanox SX1018HP Ethernet Switch offers a rich set of Layer 2 networking and security features; it also supports faster application performance and enhanced server CPU utilization with RDMA over Converged Ethernet (RoCE)—making this switch an excellent choice for any high-performance Ethernet network.

Cisco Catalyst 3120 Blade Switch series

Designed to meet the rigorous requirements of blade server environments, the Cisco Catalyst 3120 Blade Switch series is built on Cisco's hardware and IOS software.

The Catalyst 3120 Blade Switch uses a stacking technology that allows multiple switches to act as a single entity. This switch-stacking technology treats the individual physical switches within a rack as a single logical switch. This built-in ability enables the Catalyst 3120 Blade Switch to simplify operations and management. Functionality such as Layer 3 routing is available through the IP Services upgrade option.

Cisco Fabric Extender for HP BladeSystem

Providing an extension of the Cisco Nexus switch fabric to the HP server edge, the Cisco Fabric Extender for HP BladeSystem behaves like a remote line card to a parent Cisco Nexus 5000/6000 series switch. The Cisco Fabric Extender and the parent Nexus switch form a distributed modular system. The Fabric Extender for HP BladeSystem forwards traffic to the Cisco Nexus 5000/6000 series switches over eight 10GbE uplinks.

Serving as an extension of a Nexus 5000/6000, the Cisco Fabric Extender can switch Ethernet, FCoE, or iSCSI traffic according to policies established by the Nexus 5000/6000 series switch—all from a single point of management.

New Brocade 16 Gb SAN Switch

The Brocade 16 Gb SAN Switch for HP BladeSystem c-Class is a next-generation embedded switch designed for midsize and enterprise-class customers.

High-density blade server virtualization, faster multi-core server processors, and the adoption of solid-state drives (SSDs) are driving higher bandwidth requirements in data centers. The Brocade 16 Gb SAN Switch for BladeSystem c-Class enables customers to deploy enterprise-class applications on blade servers, while providing industry-leading data center performance.

HP services

Proactive, personalized, and simplified

HP Technology Services offers a comprehensive portfolio of HP Care Pack Services to help design, deploy, manage, and support your blades-based virtualized environment. The HP Technology Support Services portfolio is:

- Proactive to help prevent problems before they occur
- Personalized to give you the right balance of coverage and control
- Simplified to keep your team productive

Enhanced optimum service-level HP Care Pack offerings

HP Proactive Care with six-hour call-to-repair hardware onsite support, and three-year coverage. HP Proactive Care Services are geared toward today's IT environments, combining a carefully designed mix of proactive advice, automated alerts, proactive reports, and rapid expert support.

Offered as HP Care Pack Services or as a support contract, HP Proactive Care provides:

- Proactive advice and reporting, which includes platform reviews, analyses, and scans
- A superior call experience with rapid connection to advanced technical expertise and end-to-end call ownership
- A choice of reactive hardware support levels
- HP Proactive Care Personalized Support option, assigned you a local account support manager

For more on HP Proactive Care, visit: hp.com/services/ProactiveCare

To round out your HP support experience, you can choose:

- Blade Infrastructure plus Enhanced Network Installation and Startup services to ensure your BladeSystem environment is configured and ready when you are
- HP Software Support for industry-leading software such as Microsoft, Red Hat®, SUSE Linux, or VMware. Buy your subscriptions and support from HP for the life of your BladeSystem to further simplify your operations. Make the first call to HP.

Minimum recommended HP Care Pack offerings

HP Proactive Care with 24x7 hardware support, four-hour response, three-year coverage.

Important note about support on options in this data sheet

To receive support services (beyond warranty) for certain hardware server options, you must purchase a support service for each individual option. These support services are available for purchase with the primary product. For a list of components that require separate support, please visit: hp.com/services/excludedoptions.

HP Care Pack Services benefits

- Deploy your infrastructure quickly, delivering faster return on investment
- Increase server uptime, performance, and availability to your business
- Detect and diagnose problems automatically, resulting in quick repairs—saving time, money, and resources

For more information visit: hp.com/services/bladessystem

Customize your IT lifecycle management, from acquisition of new IT, management of existing assets, and removal of unneeded equipment.

hp.com/go/hpfinancialservices

Transform your data center and make it future ready. To understand how HP Virtual Connect solutions can help visit:

HP Factory Express

HP Factory Express provides customization and deployment services along with your storage and server purchases. You can customize hardware to your exact specifications in the factory—helping speed deployment. hp.com/go/factoryexpress

Customer Technical Training

Gain the skills you need with ExpertOne training and certification from HP. With HP ProLiant, training, you will accelerate your technology transition, improve operational performance, and get the best return on your HP investment. Our training is available when and where you need it, through flexible delivery options and a global training capability. hp.com/learn/proliant
