CHAPTER 1: OVERVIEW

1.1 INTRODUCTION

This manual is a Getting Started Guide. It is a walkthrough of the HTML5 UI of EMEMS Software and a demonstration of its important features.

This is not a complete setup manual. We'll explain only the important sections with a little more detail.

98% of AlertWerks features are also on the HTML5 UI and configuring them matches the Windows client (wx).

1.2 EMEMS SOFTWARE FEATURES

- EMEMS Software has a built-in web server (HTML UI) that provides access to AlertWerks management without installing a separate AlertWerks client program. You just need an HTML5 compatible web browser running on any device to be able to manage your AlertWerks installation (more on this feature later).
- Supports new sensors such as ILPM and Temperature and Humidity Sensor String.
- AlertWerks code is written on a modern compiler, so it has better performance on modern OS's.
- AlertWerks now has a memory dump feature that will help troubleshoot and fix issues. Your support staff and engineers will primarily use this feature.

Further development and new features will be added to the HTML5 interface.

NOTE: Some existing features are missing from the HTML UI, but the feature coverage is over 98% compared to the Windows client.

- AlertWerks is fully Unicode aware; you can specify and use Unicode characters (for example, for path names and action names).
- The Backup & Restore feature should produce smaller backups when video recording is used (it doesn't include the Reserved folder in the backup).
- EMEMS Software includes a graph library.
- When you uninstall EMEMS Software, the default option is to keep your user data and settings (but you can choose to remove them).

Licensing features for AlertWerks:

- The product requires activation for using more than one sensor of each type, but the demo usage doesn't require online registration with email. AlertWerks will use an offline Default license.
- If you already have a paid Active license and online access, AlertWerks will automatically activate itself after installation. There is no need to run the Activation Wizard on first use.
- You can also activate using a license file that has been sent over email. There is no need to copy and paste a long activation key (but this method is still supported).

CHAPTER 2: INSTALLATION AND UPGRADE

Installation is designed to be simple and easy. To install, run the installer and follow the wizard.

2.1 SERVER INSTALLATION

If you have used AlertWerks installer before, the steps are identical, except for configuring the built-in web server's ports for the server installation.

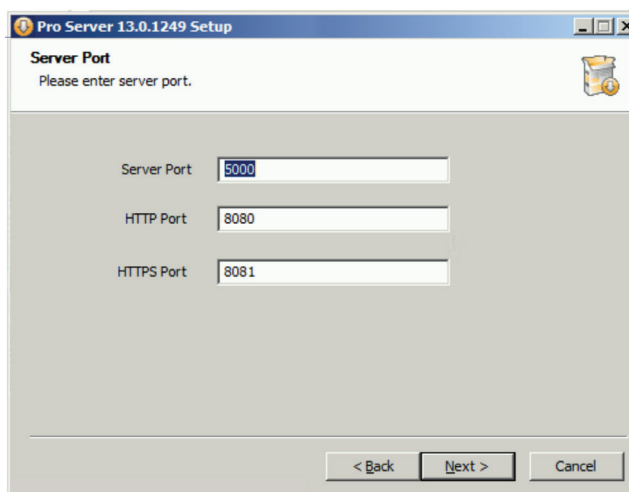

FIGURE 2-1. SERVER PORTS

The installer will ask you for ports for the Web UI (HTTP, HTTPS) and server port (which is used by the monitored devices to communicate with AlertWerks).

You may change them if the ports are in use by other applications, e.g. Oracle database server Web UI. The installer will check and notify you if the ports are in use.

Important note: You need to ensure that your firewall, security or antivirus software is not blocking the ports noted above, or that any other application running on the computer is not using these ports. For example, Skype, which can run on port 8080.

2.2 CLIENT INSTALLATION

The Windows client installation in AlertWerks won't ask you for the web server's port configuration as it's a server component.

However, normally you don't need to install AlertWerks client software if you have a web browser on the device - except for when using some of the Windows client-only features.

Here are some installation examples:

1. Install Server with Client - you can manage AlertWerks locally with both the Windows client and the HTML5 UI.
2. Install Windows Client Only - you can manage AlertWerks locally with both the Windows client and the HTML5 UI.
3. Access the Server from Web Browser from Another Device (Mobile or Desktop) - you don't need to install anything on your device, just open the server's URL and log in to manage it.

CHAPTER 2: INSTALLATION AND UPGRADE

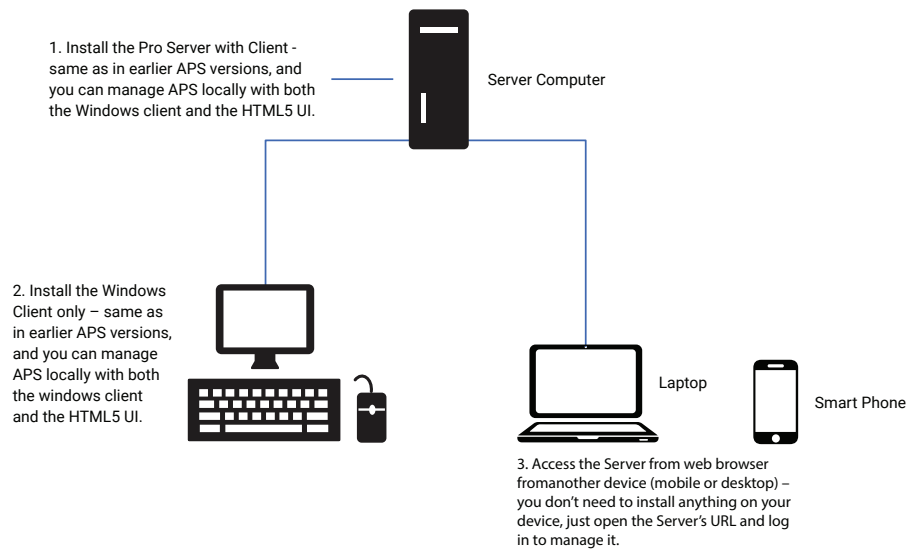

FIGURE 2-2. INSTALLATION

CHAPTER 3: HTML5 INTERFACE

There is a built-in web server (HTML UI) in AlertWerks that provides access to AlertWerks management without installing a separate AlertWerks Windows client program.

You need an HTML5 compatible web browser running on any device (mobile or desktop) to be able to manage your AlertWerks installation. Just open the server's URL and log in (see on the next page).

Important note: the HTML UI is designed for Google Chrome and Firefox only (no Safari, Edge or MS IE browsers), and we only support these browsers. You'll get a warning pop-up message if you log in with an unsupported browser. Some features might not work correctly with an unsupported HTML5 compatible browser, such as MS Edge.

3.1 FEATURES

98% of AlertWerks features are also on the HTML5 UI, and configuring them matches the Windows client (wx). Changing a setting or adding an action or sensor etc. will also appear in the Windows client and vice versa.

You can view the changes made in the Event Logs which list the user and the device's IP address that made the change.

There are some HTML UI-only settings that are only accessible from the HTML5 UI, such as Language (for HTML display language) and Services (where you can change web server ports).

3.2 WORKSPACES AND DESKTOPS

All your workspaces, desktops, user settings and configurations are stored on the AlertWerks server and changing your device or browser will have no effect on your configured settings. They will "follow you" anywhere using either the Windows client or HTML UI (provided that you log in as the same user).

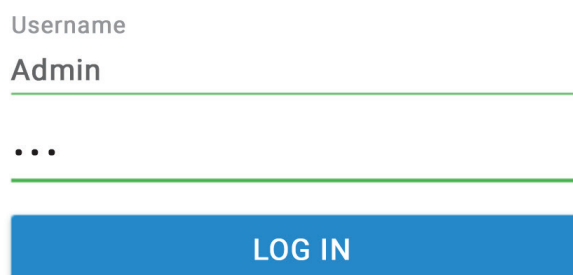

Please note: a desktop or workspace configured in the Windows (wx) client is not compatible with the HTML5 interface and vice versa. You'll need to recreate your environment for the different clients.

3.3 LOG IN TO HTML5 UI

To log in using the HTML5 interface, point your browser to the server's IP address and port. The default ports (8080 and 8081) can be seen on the previous page.

For example, to access AlertWerks on 10.1.1.121 IP address: <http://10.1.1.121:8080>

NOTE: By default, the HTTP is disabled on the HTML5 login so it will be redirected to <https://10.1.1.121:8081>. This can be changed in the Server Settings >> Services page.

Username
Admin
...
LOG IN

FIGURE 3-1. LOGIN SCREEN

NOTE: The default administrator username is Admin and you only have this username after first installation.

The password is what you've set in the installer for the Administrator (Admin) username.

CHAPTER 3: HTML5 INTERFACE
