READ THIS SOFTWARE LICENSE AGREEMENT BEFORE USING THIS PRINTER

Software License Agreement

CAREFULLY READ THE FOLLOWING TERMS AND CONDITIONS BEFORE USING THIS PRINTER. USING THIS PRINTER INDICATES YOUR ACCEPTANCE OF THESE TERMS AND CONDITIONS. IF YOU DO NOT AGREE TO THESE TERMS AND CONDITIONS, PROMPTLY RETURN THE PRINTER AND ALL ACCOMPANYING HARDWARE AND WRITTEN MATERIALS TO THE PLACE YOU OBTAINED THEM, AND YOUR MONEY WILL BE REFUNDED.

Definitions.

“Software” shall mean the digitally encoded, machine-readable data and program. The term “Software Product” includes the Software resident in the printer and its documentation. The Software Product is licensed (not sold) to you, and Printronix, Inc. either owns or licenses from other vendors who own, all copyright, trade secret, patent and other proprietary rights in the Software Product.

License.

1. Authorized Use. You agree to accept a non-exclusive license to use the Software resident in the printer solely for your own customary business or personal purposes.

2. Restrictions.
   a. To protect the proprietary rights of Printronix, Inc., you agree to maintain the Software Product and other proprietary information concerning the typefaces in strict confidence.
   b. You agree not to duplicate or copy the Software Product.
   c. You shall not sublicense, sell, lease, or otherwise transfer all or any portion of the Software Product separate from the printer, without the prior written consent of Printronix, Inc.
   d. You may not modify or prepare derivative works of the Software Product.
   e. You may not transmit the Software Product over a network, by telephone, or electronically using any means; or reverse engineer, decompile or disassemble the Software.
   f. You agree to keep confidential and use your best efforts to prevent and protect the contents of the Software Product from unauthorized disclosure or use.

3. Transfer. You may transfer the Software Product with the printer, but only if the recipient agrees to accept the terms and conditions of this Agreement. Your license is automatically terminated if you transfer the Software Product and printer.

Limited Software Product Warranty

Printronix, Inc. warrants that for ninety (90) days after delivery, the Software will perform in accordance with specifications published by Printronix, Inc. Printronix, Inc. does not warrant that the Software is free from all bugs, errors and omissions.

Remedy

Your exclusive remedy and the sole liability of Printronix, Inc. in connection with the Software is replacement of defective software with a copy of the same version and revision level.

Disclaimer of Warranties and Limitation of Remedies

1. THE PARTIES AGREE THAT ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE AND MERCHANTABILITY ARE EXCLUDED. Printronix, Inc. does not warrant that the functions contained in the Software will meet your requirements or that the operation of the Software will be uninterrupted or error free. Printronix, Inc. reserves the right to make changes and/or improvements in the Software without notice at any time.

2. IN NO EVENT WILL PRINTRONIX, INC. BE LIABLE FOR LOST PROFITS, LOST DATA, BUSINESS INTERRUPTIONS, OR ANY OTHER DIRECT, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OF OR INABILITY TO USE THIS PRODUCT, EVEN IF PRINTRONIX, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, OR ANY DAMAGES CAUSED BY THE ABUSE OR MANIPULATION OF THE SOFTWARE. SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

3. Printronix, Inc. will not be liable for any loss or damage caused by delay in furnishing a Software Product or any other performance under this Agreement.

4. Our entire liability and your exclusive remedies for our liability of any kind (including liability for negligence except liability for personal injury caused solely by our negligence) for the Software Product covered by this Agreement and all other performance or nonperformance by us under or related to this Agreement are limited to the remedies specified by this Agreement.

5. California law governs this Agreement.

Termination of License Agreement

This License shall continue until terminated. This license may be terminated by agreement between you and Printronix, Inc. or by Printronix, Inc. If you fail to comply with the terms of this License and such failure is not corrected within thirty (30) days after notice. When this License is terminated, you shall return to the place you obtained them, the printer and all copies of the Software and documentation.

U.S. Government Restricted Rights

Use, duplication or disclosure by the Government is subject to restrictions as set forth in the Rights in Technical Data and Computer Software clause at FAR 242.227-7013, subdivision (b) (3) (ii) or subparagraph (c) (1) (ii), as appropriate. Further use, duplication or disclosure is subject to restrictions applicable to restricted rights software as set forth in FAR 52.227-19 (c) (2).

Acknowledgement of Terms and Conditions

YOU ACKNOWLEDGE THAT YOU HAVE READ THIS AGREEMENT, UNDERSTAND IT, AND AGREE TO BE BOUND BY ITS TERMS AND CONDITIONS. NEITHER PARTY SHALL BE BOUND BY ANY STATEMENT OR REPRESENTATION NOT CONTAINED IN THIS AGREEMENT. NO CHANGE IN THIS AGREEMENT IS EFFECTIVE UNLESS WRITTEN AND SIGNED BY PROPERLY AUTHORIZED REPRESENTATIVES OF EACH PARTY. BY USING THIS PRINTER, YOU AGREE TO ACCEPT THE TERMS AND CONDITIONS OF THIS AGREEMENT.
This document contains proprietary information protected by copyright. No part of this document may be reproduced, copied, translated, or incorporated in any other material in any form or by any means, whether manual, graphic, electronic, mechanical, or otherwise, without the prior written consent of Printronix.

Printronix makes no representations or warranties of any kind regarding this material, including, but not limited to, implied warranties of merchantability and fitness for a particular purpose. Printronix shall not be held responsible for errors contained herein or any omissions from this material or for any damages, whether direct or indirect, incidental or consequential, in connection with the furnishing, distribution, performance, or use of this material. The information in this manual is subject to change without notice.

Introduction

Printer Overview

This chapter provides a general overview of your printer and the conventions used within this manual.

**Printronix P8000 Series Cartridge Ribbon Printers (CRP)**

Printronix® has been the global leader in industrial printing solutions for over 30 years, earning a reputation for designing and manufacturing leading edge products and delivering them to market with unsurpassed service and support.

The Printronix P8000™ Line Matrix Printing Platform extends the series of technology innovations that cement Printronix’s leadership position. Line matrix printing is Printronix’s flagship technology, and it remains the workhorse solution for supply-chain and back-office printing applications because of its reliability, lower cost of ownership and flexibility of printing applications.

- Most reliable printer ever – provides more up time and lower operating costs
- Cartridge ribbons – deliver darker image, last longer, and costs less to operate than other print technologies
- Integrated print management system – provides precise control over print quality, print costs, and job planning
- Tabletop, cabinet, pedestal, or enclosed pedestal styles – best user access and forms handling flexibility
- Unsurpassed ease of use – larger graphics LCD simplifies operation and enhances productivity
Four printer configurations are available:

**Tabletop (P80XX or P80XXH)**

- The tabletop models are designed for space constrained environments, allowing for the printer to be placed on a desk or tabletop for quiet use.
- Paper guides allow for paper input under the table or as a small stack on the table.
- Output forms are easily accessible from the front of the printer.
- Using the top paper exit, this printer is ideal for short print runs and easy access to output.
- Available in the following print speeds:
  - ASCII – 500 and 1000 line per minute models
  - H-Series – 300 and 600 line per minute models

**Cabinet (P82XX, P8200HD, or P82XXH)**

- The enclosed cabinet models provide for near silent operation, making these printers perfectly suitable for use in the quietest of office environments.
- Provides the best paper handling for large print runs. All paper input and output is contained inside the cabinet and protected from bumping and contamination.
- Highly effective combination of moveable fences and chains allows for precise stacking all the way up to a full box of paper.
- For tougher forms that tend not to refold well, a SureStak power stacker option is available for the 1500, 2000, H-Series, and OpenPrint HD enclosed cabinet models.
- Available in the following print speeds:
  - ASCII – 500, 1000, 1500 and 2000 line per minute models
  - H-Series – 600 and 800 line per minute models
  - OpenPrint HD (available only for cabinet models)

**Pedestal (P80XX, P8000HD, or P80XXH)**

- The pedestal model has a clamshell design that allows easy access to all controls providing faster ribbon replacements and easier paper loading.
- Oversized casters are standard making movement easy.
- Available in the following print speeds:
  - ASCII – 500 and 1000 line per minute models
  - H-Series – 300 and 600 line per minute models
Enclosed Pedestal (P80XX, P8100H, or P80XXH)

- The enclosed pedestal model has a lower enclosure that holds the input paper while providing for near silent operation.
- The paper enclosure can accommodate a full paper box (12” maximum length forms).
- The paper output area is not enclosed for easy access to printed media.
- Available in the following print speeds:
  - ASCII – 500 and 1000 line per minute models
  - H-Series – 300 and 600 line per minute models

Consumable Monitoring with PrintNet Enterprise

The Integrated Print Management System works with PrintNet Enterprise (PNE). PNE allows a system administrator to remotely view the current consumable status of all printers. PNE can be configured to deliver alerts on all consumable warnings. When a ribbon reaches the low state, PNE notifies the system administrator remotely via an automated e-mail alert of the low condition. This allows corrective action to be taken before the ribbon reaches its end of life. If the ribbon is not changed, an alert will again be initiated once the ribbon reaches the 0% end point. Refer to your PrintNet Enterprise Remote Management Software manual for details.

Protocols and Emulations

A protocol is a set of rules governing the exchange of information between the printer and its host computer. These rules consist of codes that manipulate and print data and allow for machine-to-machine communication. A printer and its host computer must use the same protocol. As used in this manual, protocol and emulation mean the same thing.

Most impact printers use single ASCII character codes to print text, numbers, and punctuation marks. Some characters are defined as control codes. Control codes instruct the printer to perform specific functions, such as underlining text, printing subscripts, setting page margins, etc. The difference between most printer protocols is the characters used to create control codes and the ways in which these characters are formatted.

When the printer executes the character and control codes of a particular printer protocol, it is emulating that printer.

Graphics Enhancements

The IGP/PGL and IGP/VGL emulations allow you to create and store forms, generate logos, bar codes, expanded characters, and create other graphics. Alphanumeric and bar code data are added as the form is printed.

These emulations are available as factory-installed or field-installed options, except on H-series models. For more information, contact your authorized service representative.
Taking Care of Your Printer

Your printer will produce high print quality jobs if it is well taken care of. Periodic cleaning, handling the printer properly, and using the correct printer supplies such as ribbon and paper ensures optimum performance. Chapter 7 explains how to clean the printer, and printer supplies are listed in Appendix A.

Conventions in this Manual

Control panel keys and indicators are highlighted in **UPPERCASE BOLD PRINT**.

**Example:** Press the **CANCEL** key, then press the **ONLINE** key.

Quotation marks (" ") indicate messages on the Liquid Crystal Display (LCD).

**Example:** Press the **ONLINE** key. “OFFLINE” appears on the LCD.

The + (plus) symbol represents key combinations.

**Example:** “Press △ + ▼” means press the △ (UP) key and the ▼ (DOWN) key at the same time.

Warnings and Special Information

Read and comply with all information highlighted under special headings:

**WARNING**  A warning notice calls attention to a condition that could harm you.

**CAUTION**  A caution notice calls attention to a condition that could damage the printer.

**IMPORTANT**  Information vital to proper operation of the printer.

**NOTE:** A note gives you helpful tips about printer operation and maintenance.

Contact Information

Printronix Customer Support Center

IMPORTANT Please have the following information available prior to calling the Printronix Customer Support Center:

- Model number
- Serial number (located on the back of the printer)
- Installed options (i.e., interface and host type if applicable to the problem)
- Configuration printout (Press \texttt{CONFIG} on the control panel, then press \texttt{ENTER})
- Network test page if Ethernet is enabled.
- Is the problem with a new install or an existing printer?
- Description of the problem (be specific)
- Good and bad samples that clearly show the problem (faxing or emailing of these samples may be required)

Before You Begin

Read this chapter carefully before installing and operating the printer. The printer is easy to install. However, for your safety and to protect valuable equipment, perform all the procedures in this chapter in the order presented.

Power Requirements

The printer must be connected to a power outlet that supplies 88 to 270 volts AC. The printer automatically senses and adjusts itself to conform to the correct voltage range.

Primary circuit protection is provided by the AC source protection device. Consult an electrician if printer operation affects local electrical lines.

**IMPORTANT**  
Printer power should be supplied from a separate AC circuit protected at 10 amperes for 100 - 120 volts or 6 amperes for 200 - 240 volts at 50 or 60 Hertz.

Select a Site

Select a printer site that meets all of the following requirements:

- Permits complete opening of the printer cover and doors.
- For cabinet models, allows at least three feet of clearance behind the printer. (This permits air to circulate freely around the printer and provides access to the paper stacking area.)
- For pedestal models, DO NOT placing the side of the printer (inlet and exit air vents) against a wall or other object. A minimum of 6 inch spacing is recommended.
- Has a standard power outlet that supplies 88-135 Volts AC or 178-270 Volts AC power, at 47 to 63 Hz.
- Is relatively dust-free.
- Has a temperature range of 10° C to 40° C (50° F to 104° F) and a relative humidity from 15% to 90% non-condensing.
- Is located within the maximum allowable cable length to the host computer. This distance depends on the type of interface you plan to use, as shown in Table 1.

Powering on the Printer

When you power on the printer, it executes a self-test. The default power-up state is online. When the self-test completes and the software has initialized successfully, the status indicator light turns on, indicating the printer is online. The default value of the type of emulation you have installed appears in the LCD display. The ribbon life remaining is shown on the bottom of the LCD display.

If there is a fault during the self-test, the status indicator flashes and a specific fault message appears on the display (such as “LOAD PAPER”). The alarm also sounds if it is configured to do so. See “LCD Message Troubleshooting Table” on page 250 for information on fault messages and solutions.

Operating Modes

**Online.** In online mode, the printer can receive and print data sent from the host. Pressing the ONLINE key toggles the printer from online to offline mode. The status indicator is lit in online mode.

**Offline.** In offline mode, you can perform operator functions, such as loading paper and setting top-of-form. Pressing the ONLINE key toggles the printer from offline to online mode. The status indicator is off in offline mode.

**Menu.** In offline mode, pressing ENTER moves the printer into Menu mode. In this mode, you can navigate through all menus and change the printer configuration. To return to offline mode, press the ONLINE key.

**Fault.** In fault mode, a condition exists which must be cleared before printing can continue. The status indicator flashes, the alarm beeps (if configured to sound), and a descriptive fault message displays.

The current operating mode can be selected via control panel keys or can result from routine operations such as powering on the printer.
The Control Panel

Figure 7 shows the keys, displays, and indicators as they appear on the control panel. The following section provides the descriptions, and functions of the control panel keys.

Key combinations are indicated with the plus (+) sign. For example, “Press △ + ▼” means to press the △ key and the ▼ key at the same time.

Cabinet Model

Legend:
TOF = Set TOF (Top of Form)
VIEW = View/Eject
ADVANCE = Paper Advance
CONFIG = Print Config
SELECT = Load Config/Print Mode
CANCEL = Cancel Job
ONLINE = Online/Clear

NOTE:
1 Print Mode only available for H-Series printers.

Pedestal Model

Figure 7. Control Panel
Control Panel Keys

ONLINE
Toggles the printer between online and offline modes. The key performs the following in Online, Offline, Fault, and Menu modes:

- **Online Mode** – sets the printer to Offline Mode.
- **Offline Mode** – sets the printer to Online Mode.
- **Fault Mode** – causes the printer to recheck the faults; if the faults are cleared, the printer toggles to Offline Mode. If the fault condition is not corrected before pressing the ONLINE key, the fault message reappears.
- **Menu Mode** – sets the printer to Offline Mode.

**NOTE:** When changing to Online Mode, if the user has changed menu items without saving the changes in a configuration, the user will be prompted to save the changes.

ADVANCE
Performs advance to top-of-form, as defined by the current active form length. The key works both online and offline.

- If online with data in the printer buffer, the data will print and then the paper will move to the next top-of-form.
- In the fault state, pressing ADVANCE will advance the paper. The first press moves to the top of the next available form. All subsequent presses advances one forms length as defined by the current active forms length.

VIEW
When the printer is online or offline, pressing this key executes the view or eject function, depending on whether the printer is a cabinet or a pedestal (or zero tear pedestal).

If online with data in the printer buffer, the data prints and the key functions as described below.

If in a fault state, this key will be ignored.

- **View Function** — for cabinet models, pressing the VIEW key moves the last data printed to the tractor area for viewing. While in the view state, the message “Printer in View” displays, pressing the UP or DOWN arrow keys moves the paper up or down in 1/72 inch increments. This is done to align the image within a pre-printed form, for example. Refer to the UP and DOWN key functions for additional details on the microstep feature. Pressing VIEW a second time moves the paper back to the adjusted print position.
- **Eject Function** — for pedestal models, when the VIEW key is pressed, the bottom of the last printed form will move to the tear bar position. The message “READY TO TEAR/EJECT To Return” displays. While in this position, pressing the UP or DOWN arrow keys moves the paper up or down in 1/72 inch increments. Refer to the Up and Down key functions for additional details on the microstep feature. When the VIEW key is
pressed a second time, the printer will move the paper to enable printing on the next available form.

CANCEL

In offline mode, this key cancels all data in the print buffer, if enabled in the “ADVANCED USER Menu” (see page 207). The print buffer is cleared without printing any of the data and the current paper position is set as the top-of-form. If this function is disabled, the CANCEL key will be ignored.

NOTE: 1. Use of this key will cause loss of data.

2. For OpenPrint products, pressing the CANCEL key advances the paper to the next TOF.

TOF

Sets the top-of-form on the printer. This key is active only when the printer is offline and will not operate if the printer is in a fault condition. The paper moves down to the print position and aligns to the top-of-form. Refer to the Quick Setup Guide for complete instructions on how to set the top-of-form.

NOTE: If there is any data in the buffer, the paper will move to the last print position.

CONFIG

In offline mode, CONFIG prints the current short configuration. This key requires a confirmation with the ENTER key; pressing any other key will exit from this function. See “The Configuration Menus” on page 47 for an explanation of configuration menus.

SELECT

In offline mode, this key allows for fast selection of any of the previously stored configurations. Pressing this key causes the printer to cycle through the following configuration load options: Factory, Cfg 1, Cfg 2, Cfg 3,..., Cfg 8.

For H-Series models, this key can be alternatively configured to select Print Mode.
ENTER (↓)

When navigating the configuration menus, the Enter key (referenced by the symbol ↓) selects the currently displayed option value as the active value. An asterisk (*) appears next to the active value on the display. Enter is also used for starting and stopping printer tests and generating a configuration printout.

**NOTE:** The Enter key must be unlocked in order to function.

See UP + DOWN, later in this section.

The ENTER key lock and unlock function can be configured to be a key combination other than △ + ▽ (see page 222).

- In Offline mode, pressing the Enter key places the printer in Menu mode. This will bring up a set of icons to select.

- In Menu mode (at the icon menu level), pressing the Enter key moves down into the menu tree of the highlighted icon.

- Within a menu tree: if the highlighted menu contains submenus instead of a selectable parameter, pressing the Enter key will go into the submenu.
  
  If the highlighted menu is a display only menu, then pressing the Enter key performs no function. If the highlighted menu has selectable parameters, pressing the unlocked Enter key will select the displayed parameter. An asterisk (*) displays next to the selected parameter.

- If the highlighted menu is an executable menu, pressing the unlocked Enter key will cause the function associated with the executable menu to run. If the ENTER key is locked, pressing the Enter key for highlighted menus that are executable or contain selectable parameters will cause the message, THE ↓ KEY IS LOCKED, to display momentarily.

**NOTE:** Press the UP and Down keys at the same time to lock/unlock the ↓ key.

For special Network Address menus or String menus, pressing the Enter key will move down into a special multiple segment setting menu. Exit this menu by pressing Enter again to save changes or Cancel to exit without saving changes. This key is inactive in all other modes.

UP or DOWN (△ or ▽)

Moves up or down between levels in the configuration menus and makes vertical forms adjustment. After pressing VIEW, press △ or ▽ to adjust the paper up or down in 1/72 inch increments for fine vertical forms alignment. When the printer is in offline mode, press △ or ▽ to move through levels in the configuration menus.

UP + DOWN (△ + ▽)

Locks and unlocks the ENTER key.

**NOTE:** The ENTER key lock and unlock function can be configured to be a key combination other than △ + ▽ (see page 222).
PREV or NEXT ( '\' or '}->

Moves between the options on the current level of configuration menu. In the configuration menu, press '<' to scroll backward or press '>' to scroll forward through the menu selections on the same level.

PREV + NEXT ( '\ '< '+' '}->)

When both keys are pressed simultaneously, the printer will reset to the power-up configuration and reset its internal state (in offline mode).

'\ '+' ONLINE (IPDS Emulation only)

In offline mode, press '\ '+' ONLINE. If there is data in the printer buffer, the printer will be placed in online mode, print one page, and return to the offline mode. This action can be repeated until the end of a print job. Only one page prints each time you press '\ '+' ONLINE. If there is no data in the printer buffer, the printer is placed in online mode.

In the fault state, '\ '+' ONLINE does not work.

'\ '+' ADVANCE (IPDS Emulation only)

In offline mode, press '\ '+' ADVANCE. The printer will perform a reverse linefeed. If you hold down the '\ '+' ADVANCE keys for longer than 1/2 second, the printer moves to the previous top-of-form position. If there is data in the printer buffer, the data does not print.

In the fault state, '\ '+' ADVANCE does not work.

'\ '+' VIEW (IPDS Emulation only)

In offline mode, press '\ '+' VIEW. If there is data in the IPDS printer buffer, the printer will be placed in online mode, print one line, and return to offline mode. This action can be repeated until the end of the job. This function prints only one line of text. If the data is not text, only 1/6 inch prints. If there is no data in the printer buffer, the printer is placed in online mode for one second and then returns to offline mode.

In the fault state, '\ '+' VIEW does not work.

Ribbon Life Indicator

The bottom of the LCD displays the remaining life of the currently installed ribbon. The default settings for this feature should match the requirements for most applications; no special user setup is needed. If your particular application requires darker printing or can tolerate lighter printing, the ribbon end point can be adjusted as appropriate. Please refer “Ribbon End Point” on page 81.
Cancel a Print Job

The procedure to cancel a print job depends on the printer emulation and your application software. Contact your system administrator for additional information.

1. If the printer is online, press ONLINE to place the printer in offline mode.
2. From the host system, stop the print job.

**NOTE:** If the print job is not stopped from the host system before pressing CANCEL, the print job continues with data missing when the printer returns to online mode. Exercise caution to prevent unwanted data loss occurrences, as this function deletes unprinted data in the printer. This function is active only in offline mode; the purpose of this function is to eliminate the necessity of printing unwanted data when print jobs are canceled.

3. Press CANCEL.

**NOTE:** You may need to enable the Cancel option on the front panel. See "ADVANCED USER Menu" on page 207 for details.

4. Set the top-of-form. Refer to the *Quick Reference Guide*. 
Operational Procedures

This section contains routine printer operating procedures on how to:
- reload paper
- unload paper

Reload Paper

Do this procedure when “LOAD PAPER” displays. (This message occurs when the last sheet of paper passes through the paper slot.) This procedure reloads paper without removing the last sheet of the old paper supply, while retaining the current top-of-form setting.

Figure 8. Paper Slot Location
1. Raise the printer cover. Raise the platen lever as far as it will go. (See Figure 6 on page 22 for the location of the lever.)

**NOTE:** Do not open tractor doors or remove the existing paper.

2. **Tabletop models:** place the paper supply on the table underneath the printer, centered under the paper slot. See Figure 8 on 30.

   **Cabinet models:** open the front door and align the paper supply with the label on the floor.

   **Pedestal models:** place the paper supply on the floor of the printer, centered under the paper slot.

   **Enclosed pedestal models:** open the front door and place the paper supply inside the printer, on the floor of the cabinet.

3. Ensure the paper pulls freely.

4. Feed the paper up through the paper slot (see Figure 8). It may be easier to feed one corner of the new paper up through the slot first. When this corner can be grasped from the top, rotate the paper back to the normal position.

**NOTE:** If you are using thick, multi-part forms and are unable to load the new paper over the existing paper, go to step 15.

5. Hold the paper to prevent it from slipping down and through the paper slot.

6. Pull the new paper above and behind the ribbon mask, but in front of the existing paper. See Figure 6 on page 22 for the ribbon mask location. If necessary, gently press the existing paper back.

7. Align the top edge of the new paper with the top perforation of the existing paper.
8. Load the new paper over the existing paper. Open and load the tractors one at a time to prevent the paper from slipping.

**NOTE:** Make sure that the top edge of the new paper lines up with the top horizontal perforation of the last page.

9. Turn the platen stop knob clockwise or counterclockwise to match the paper thickness. (The A-B-C scale corresponds approximately to 1-, 3-, and 6-part paper thickness).

**NOTE:** If you are using the same thickness of paper, there is no need to readjust.

10. Lower the platen lever until it stops.

11. Press **ONLINE** to remove the “LOAD PAPER” fault message from the display.

12. Press **ADVANCE** several times to make sure the paper feeds properly beyond the tractors and over the lower paper guide. Feed sufficient paper to ensure the paper stacks correctly.

13. Close the printer top cover. Close the cabinet front door.

14. Press **ONLINE** to place the printer in online mode and resume printing.
NOTE: Perform steps 15 to 31 only if you are unable to load the new paper over the existing paper.

15. Open both tractor doors.

16. Remove the old paper from the tractors. Allow the paper to fall into the paper supply area.

17. Feed the new paper up through the paper slot. Hold the paper to prevent it from slipping down through the paper slot (see Figure 8 on page 30).

18. Pull the paper above and behind the ribbon mask. See Figure 6 on page 22 for the ribbon mask location.

19. Load the paper on the left tractor.

20. Close the tractor door.
CAUTION To avoid damage to the printer caused by printing on the platen, always position the left tractor unit directly to the left of the “1” mark on the paper scale.

21. Normally, you should not need to adjust the position of the left tractor. If adjustment is necessary, unlock the left tractor by placing the tractor lock in the middle position. Slide the tractor until it is directly to the left of the number “1” on the paper scale and lock it. (You can also use the paper scale to count columns.)
22. Unlock the right tractor.

23. Load the paper onto the sprockets and close the tractor door. If necessary, slide the right tractor to remove paper slack or to adjust for various paper widths. Then, lock the tractor.
24. **Tabletop or Pedestal models:**
Using the vertical position knob to move the paper up, guide the paper over the upper paper guide and through the slot to the rear of the top cover.

25. Press **ADVANCE** several times to make sure the paper feeds properly beyond the tractors and over the lower paper guide. Feed sufficient paper to ensure the paper stacks correctly.

26. **Cabinet models:**
Open the cabinet rear door. Make sure the paper is aligned with the label in the output area (inside the cabinet). Close the front and rear doors.
Figure 15. Aligning the Perforation with the TOF Indicator

27. Align the top of the first print line with the TOF indicator on the tractor by rotating the vertical position knob. For best print quality, it is recommended that the top-of-form be set at least one print line or more below the perforation.

**NOTE:** For exact positioning, press the **VIEW** key to move the last data printed to the tractor area for viewing. While in View mode “Printer in View” displays. Press the Up or Down Arrow keys to move the paper vertically in small increments. Pressing the **VIEW** key a second time moves the paper back to the adjusted print position. The key works both online and offline provided that the printer is in View mode. (This procedure is applicable for both the cabinet and pedestal models.)
28. Turn the platen stop knob clockwise or counterclockwise to match the paper thickness. (The A-B-C scale corresponds approximately to 1-, 3-, and 6-part paper thickness. Adjust until you have the desired print quality).

**NOTE:** The platen stop allows you to set an optimum and consistent thickness that is not affected when opening and closing the platen lever.

29. Lower the platen lever until it stops.

30. Press ONLINE to clear any fault messages (such as “LOAD PAPER”) from the LCD.

31. Press TOF. The top-of-form you have set moves down to the print position. If there is data in the buffer, the paper moves forward to the last print position on the next page.

32. Press ONLINE and close the printer cover.
Unload Paper

1. Press ONLINE to place the printer in offline mode and open the printer cover.

2. For cabinet models, open the cabinet rear door. For models with the power stacker installed, press the STACKER UP key on the rear control panel.

3. Tear off the paper at the perforation.

4. Allow the paper to fall to the back of the printer and into the paper stacking area.

5. For pedestal models, remove the stacked paper from the paper tray.

Figure 17. Unloading the Paper from the Printer
Figure 18. Removing Stacked Paper from the Printer

6. For cabinet models, remove the stacked paper from the rear cabinet floor. For cabinet models with the power stacker installed, remove the paper from the wire paper tent and press the STACKER DOWN key to lower the stacker mechanism.

7. Close the cabinet rear door.
Figure 19. Completely Removing the Paper

8. To completely remove the paper from the printer:
   a. Raise the platen lever as far as it will go and open both tractor doors.
   
   **CAUTION**  Be careful when pulling any paper backward through the paper path, especially when using a label stock. If you are not careful, labels can detach and adhere to the printer within the paper path, where only an authorized service representative can remove them.

   b. Open the cabinet front door.

   c. Gently pull the paper down through the paper slot. Allow the paper to fall into the paper supply area.

   d. Remove the paper from the paper supply area.
The P8000 has a feature that automatically monitors and communicates the status of the ribbon life to help the operator know when to change ribbons. Using an ink delivery system called the Cartridge Ribbon System (CRS), the printer can automatically detect when a new or used ribbon is loaded, and all ribbon properties. The ribbon is contained in a plastic box (the cartridge) and feeds only in one direction. The CRS contains an interface board that allows communication between the printer and the cartridge. Using the CRS, the P8000 automatically detects when a new or used ribbon is installed and determines the ribbon’s length, ink color, and expected yield. The ribbon life, starting from 100% when new and decreasing to 0% when depleted, is always displayed on the control panel. See Figure 7 on page 24.

When the ribbon life reaches 2%, a warning message “RIBBON UNDER 2% / Change RBN soon” appears on the control panel display. The control panel status indicator lamp flashes. The printer will continue printing in this condition until the ribbon life reaches 0% at which time, printing will stop. The ribbon may be changed at any time while the printer is in the “CARTRIDGE AT END POINT/Change Cart” condition without losing data in the printer’s buffer. If a new ribbon is loaded, the system automatically detects the change, clears the condition when the platen is closed, and restarts the life at 100%. If a partially used ribbon is loaded, the system continues the life at the percentage indicated for the used ribbon.

You may also resume printing for approximately two more minutes without changing the ribbon by pressing the ONLINE key twice. This may be done as many times as needed to complete the job in progress.

Ribbon usage information is calculated by maintaining a count of impressions (dots) that is stored on the ribbon cartridge and updated periodically so that the cartridge can be used on a different printer with the information intact. This allows the system administrator to have precise control over print quality and consumable costs. The accurate presentation of available ribbon life allows for efficient planning of print jobs. For example, if the displayed ribbon life were low, you can install a new ribbon before printing a large print job.

Output Darkness

By default the system is configured to meet most user requirements. However, some applications require that the output remains darker than the nominal set point while some applications are less critical and could tolerate a lighter final image. The system can easily adjust to this variability. A setting under the Printer Control menu is available that allows the user to adjust the final output. The range is as follows:

Normal (Default)
Darker +1 through +6
Lighter -1 through -10

The ribbon life indicator always cycles between 100% and 0%, but if a darker setting is selected, zero will be reached more quickly. If a lighter setting is selected, the system will extend the amount of printing it takes to reach zero.
Loading a Used Ribbon Cartridge

You can take the ribbon cartridge off the printer and reload it at a later time. The ribbon life gauge automatically updates to reflect the correct remaining capacity.

**NOTE:** Since the ribbon usage information is stored on the ribbon cartridge, you can reload a partially used cartridge onto a different printer.

Lighter or Darker Print

The ribbon life value as determined by the Integrated Print Management System is factory set so that the image quality at the end of the ribbon life is as good as it was when the ribbon was new. You may adjust the ribbon end point for a lighter or darker image as required for your printing needs. See “PRINTER CONTROL Menu” on page 204.
## Changing Ribbon Cartridge

Before changing the ribbon cartridge, determine whether at the end of ribbon life if you want to make the print lighter (extend the ribbon life) or darker (shorten the ribbon life). If you want to make the print lighter or darker, go to “Ribbon End Point” on page 81 and follow the procedures for adjusting the image density. If you are satisfied with the print darkness, continue with the following steps.

**NOTE:** Ribbon cartridge instructions and illustrations shown in the following section are for the pedestal model. Follow the same procedures for the cabinet model.

---

1. Open the printer cover.
2. Raise the platen lever as far as it will go.
3. Close the tractor doors.
4. Remove the old ribbon cartridge and discard properly.

---

![Figure 20. Preparing to Load the Ribbon](image)

---

**Figure 20. Preparing to Load the Ribbon**

1. Open the printer cover.
2. Raise the platen lever as far as it will go.
3. Close the tractor doors.
4. Remove the old ribbon cartridge and discard properly.
Figure 21. Installing the Ribbon Cartridge

5. Remove the ribbon slack on the new ribbon cartridge by turning the ribbon tension knob clockwise.

CAUTION Do not turn the ribbon tension knob counterclockwise. This could damage the ribbon cartridge.

6. Hold the cartridge at an angle, so that the rear side nearest you is lower than the side with the ribbon. Find the two tabs on the outside of the cartridge and place them into the corresponding slots on the air shroud assembly (see Figure 21).
Figure 22. The Ribbon Cartridge Snapped in Place

7. Rock the cartridge downward, making sure that the ribbon goes between the guide and the mask (see Figure 22). You will feel it snap into place.

**CAUTION** Make sure that the ribbon does not twist or fold over.

8. Turn the ribbon tension knob clockwise a few times to make sure the ribbon tracks correctly in the ribbon path.

9. Close the platen lever.

10. Close the printer top cover.

11. Press the ONLINE key twice to return the printer to operation.
The Configuration Menus

Configuration Overview

To print data, the printer must respond correctly to signals and commands received from the host computer. Configuration is the process of matching the printer's operating characteristics to those of the host computer and to specific tasks, such as printing labels or printing on different sizes of paper. The characteristics which define the printer’s response to signals and commands received from the host computer are called configuration parameters.

You can configure the printer using the configuration menus and the control panel or by sending control codes in the data stream from a host computer attached to the printer. This chapter provides an introduction to configuring the printer and includes the configuration menus available (depending on which emulation you have installed in the printer).

IMPORTANT Configuration directly affects printer operation. Do not change the configuration of your printer until you are thoroughly familiar with the procedures in this chapter.

Main Menu

The Main Menu is organized based on the following firmware types:

1. P8000 Standard Firmware (IPDS/PGL/VGL/LP+)
2. P8000 TN Firmware (TN/PGL/VGL/LP+)
3. P8000 PCL-II Firmware (PCL-II/PGL/VGL/LP+)
4. P8000 LG Firmware (LG/PGL/VGL/LP+)
5. P8000 ANSI Firmware (ANSI/PGL/VGL/LP+)
6. OpenPrint P8000 Standard Postscript/PDF Firmware (PS/PGL/VGL/LP+)
7. OpenPrint P8000 HD Postscript/PDF Firmware (PS)
8. H-Series Firmware (LP+)
Changing Parameter Settings

You may change a printer parameter setting, such as line spacing or forms length, either by pressing keys on the control panel or by sending emulation control codes in the data stream from a host attached to the printer. The control panel allows you to configure the printer’s resident set of configuration menus. An example procedure for using the control panel to change parameter settings begins on page 52.

When control codes are sent from a host attached to the printer, they override control panel settings. For example, if you set the line spacing to 6 lpi with the control panel, and application software later changes this to 8 lpi with a control code, the control code overrides the control panel setting.

Saving Parameter Settings

The parameter settings that you have changed can be permanently stored in the printer’s memory as a configuration. See “Auto Save Configuration” on page 56 and “Saving Your New Configuration” on page 57.

You may also save your new configurations using the PTX_SETUP command host control code. See your IGP/PGL Programmer’s Reference Manual for details.

Default and Custom Configurations

A configuration consists of a group of parameter settings, such as line spacing, forms length, etc. Your printer provides a fixed default configuration and allows you to define several custom configurations for use with particular print jobs. The factory default configuration can be loaded, but it cannot be altered.

Eight configurations can be modified for unique print job requirements. The “Save Config.” option allows you to save eight groups of parameter settings in memory as custom configurations numbered from 1 through 8. An explanation on how to save a set of parameter values as a custom configuration using the “Save Config.” menu option begins on page 57.
Navigating the Menus

To manipulate configurations review the following instructions about navigating through the menus.

You must be Menu mode to navigate the menus.

Press to toggle between ONLINE and OFFLINE. Press ENTER to enter Menu mode. Menus are accessed only in Menu mode.

Scroll up, down, left, or right through the icons to highlight the area of interest.

Press to enter the area of interest. This will take you into that section and list three menu selections, with the middle selection highlighted.

NOTE: For display languages in Korean, Simplified Chinese, or Traditional Chinese, only one menu selection is shown at a time.

Press to move up or down through the menu selections. The highlighted menu is the active selection.

Press to scroll through the available choices for the highlighted menu. If the highlighted menu contains submenus, these buttons have no effect and the message “↵ for Submenu” will display.

Press to confirm selection. For normal menus, this will change or execute the menu. If the selection has submenus, the submenu will be entered.

Press to lock and unlock the ENTER key. The ENTER key is locked by default to prevent you from accidentally changing the printer configuration. The lock and unlock function can be configured to be other than △ + ▼ (See “Set Lock Key” on page 222.)
Press to return to the previous menu level.

Press to return to Offline mode. If changes were made, the user will be prompted to save or discard the configuration.

To experiment with navigating the menus, use the example on the next page as a tutorial.

**Top Level Menu Overview**

When entering Menu mode, the user will see top level menus represented as icons as shown below. Use the navigation buttons up, down, right, and left to highlight the desired icon. As the user navigates, the name of the top level menu displays on the top line of the LCD.

Table 2 provides brief descriptions of first level configuration menu options:

<table>
<thead>
<tr>
<th>Menu Icon</th>
<th>Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Quick Setup Icon" /></td>
<td>QUICK SETUP</td>
<td>These options allow quick access to the most frequently changed or inputted parameters during the installation of the printer.</td>
</tr>
<tr>
<td><img src="image" alt="Printer Control Icon" /></td>
<td>PRINTER CONTROL</td>
<td>This menu allows you to select parameters common to a general user, such as display language and Barcode quality.</td>
</tr>
<tr>
<td><img src="image" alt="Advanced User Icon" /></td>
<td>ADVANCED USER</td>
<td>This menu allows you to select several advanced operating parameters for the printer, such as the speed at which paper will advance when slewing. The SURE SCAN menu for OpenPrint models is under this menu.</td>
</tr>
<tr>
<td><img src="image" alt="Config Control Icon" /></td>
<td>CONFIG. CONTROL</td>
<td>These options allow you to save, print, load, delete, name, and reset entire sets of configuration parameters.</td>

<td>This menu allows you to configure the options which are available for the current operating (active) emulation. For example, if LinePrinter+ is the active emulation, then the LinePrinter+ emulation options can be configured using this menu. The <strong>ACTIVE IGP EMUL</strong> and <strong>ACTIVE EMULATION</strong> menus are under this menu.</td>
</tr>
<tr>
<td><img src="image4.png" alt="Icon" /></td>
<td>DIAGNOSTICS</td>
<td>This menu includes the diagnostic tests, system memory, software build part number, Feature File (if one exists), the shuttle type, and statistics of the printer. The <strong>Printer Mgmt</strong> menu is under this menu.</td>
</tr>
</tbody>
</table>
Chapter 4  Top Level Menu Overview

Changing Parameters Example

A configuration consists of several parameters. The default factory configuration has a starting set of parameters. In the configuration menu above, and in all the configuration menus in this chapter, the factory default values are indicated by an asterisk (*).

Your print jobs may require parameter values which vary from the default settings. This section provides an example procedure for changing individual parameter values.
The following procedure shows how to change and save the settings for the Barcode Quality and Panel Display options. Use these guidelines to navigate the configuration menus and change other parameters.

</tr>
</tbody>
</table>
| 16.  | ONLINE | Menu Changes Detected  
Save Permanently  
Save Temporarily  
Cancel Changes  
Restore Factory  
Press ▼ to Select | Configuration changes were detected and you are prompted to save the configuration permanently or temporarily, to cancel changes, or restore the Factory Configuration. |
| 17A. | ENTER | Cfg=Cfg 1  
= Power-Up Cfg | Saves the Configuration as Config 1 then returns the printer ONLINE. |
| 17B. | ONLINE | P8210  
ETHERNET/IPDS  
RIBBON LIFE 98% | Places the printer online after permanently saving the configuration changes as Config 1. |
| 18.  | | | The printer is ready for operation |
Auto Save Configuration

If the user makes a menu change and attempts to place the printer online without saving the changes to a configuration, the following prompt displays:

![Menu Changes Detected]

The active option is highlighted. Use the Up and Down keys to scroll through the different options; the keys will loop at the top and bottom options. The ↵ (Enter) key selects the highlighted option. After performing the selected option, the printer will go to Online mode.

**NOTE:** Only the Up, Down, and Enter keys work at the Menu Changes Detected prompt.

- **Save Permanently** (factory default). This option causes the printer to save the configuration to the active configuration and make the active configuration the Power-Up default configuration. If the active configuration is the Factory Configuration, the printer will save the configuration to an open configuration and make that open configuration the Power-Up default configuration.

  If no open configuration is available, the user must decide which configuration to overwrite. In this case the printer will display the Save Configuration menu, otherwise, the printer will go Online.

- **Save Temporarily.** Menu changes will be implemented, but will not be saved once the printer is powered off.

- **Cancel Changes.** This option causes the printer to reload the Active Configuration, then go Online.

- **Restore Factory.** This option will cause the printer to reload the Factory Configuration, then go Online.

**NOTE:** A printer fault during the Auto Save process causes the printer to Save Temporarily.
Saving Your New Configuration

The Save Config. option allows you to save up to eight custom configurations to meet different print job requirements. Once you have changed all of the necessary parameters, you may save them as a numbered configuration (Example 1 on page 58) or a named configuration (Example 2 on page 60) that can be stored and loaded later for future use. If you do not save your configuration using the Auto Save, or this option, all of your parameter changes will be erased when you power off the printer.

Once you have saved a custom configuration using this option, it will not be lost if you power off the printer. You can load a configuration for a specific print job (see “Load Config.” on page 83). You can also modify and resave it. You may want to print your configurations (see “Print Config.” on page 83) and store them in a safe place, such as inside the printer cabinet. If the Protect Configs. parameter is enabled and you try to resave an existing configuration, the new configuration will not be saved until the existing configuration has been deleted (see “Delete Config.” on page 84).

**NOTE:** Once you change active emulations, any changes to the previously selected emulation will be gone unless they have been saved.
Example 1

This example shows how to save a configuration as a numbered configuration, then later print it.

Optimizing Print Quality

LP+, IGP/PGL, and IGP/VGL Emulations

You can optimize print quality for darker and sharper barcodes and characters. Doing so, however, will decrease the printer speed.

To optimize print quality, you can change the values of the following configuration parameters:

- **Bar Code Quality (Printer Control menu):** Select “Dark” or “Draft.” Dark prints the darkest images, but at the slowest speed. Draft prints at a faster speed than Dark, but the characters are not as dark. (See page 205 for a written description of Bar Code Quality.)

- **Print Quality (IGP/PGL emulation):** Select “Best” or “High.” Best prints the darkest images, but at the slowest speed. High prints at a faster speed than Best, but the characters are not as dark. (See page 163 for the IGP/PGL Configuration Menu, and page 170 for a written description of Print Quality.)

- **Print Quality (IGP/VGL emulation):** Select “High.” (See page 174 for the IGP/VGL Configuration Menu, and page 178 for a written description of Print Quality.)
OpenPrint Postscript/PDF Emulations

You can optimize print quality for darker and sharper text and barcodes by using the following configuration parameters:

- **Unidirectional (Printer Control menu):** Select “Enable” for best quality but reduced throughput (half speed).
- **Resolution (Postscript/PDF menu):** Select higher values (horizontal by vertical DPI) to get better print quality.

H-Series Emulations

Print quality varies based on the typeface selected. Both text and barcodes will print using the resolution of the selected typeface.

Optimizing Print Speed

**LP+, IGP/PGL, and IGP/VGL Emulations**

The printer has been configured at the factory for optimal print speed. To optimize print quality instead, you can change values for specific configuration parameters such as Barcode Quality and Print Quality. Doing so, however, will decrease the printer speed.

If you have optimized the printer for print quality, you can change it to optimize the speed by selecting the values as follows:

- **Bar Code Quality (Printer Control menu):** Select Draft.
  (See page 204 for the Printer Control Menu, and see page 205 for a written description of Bar Code Quality.)
- **Print Quality (IGP/PGL emulation):** Select Dataprocessing.
  (See page 163 for the IGP/PGL Configuration Menu, and see page 170 for a written description of Print Quality.)
- **Print Quality (IGP/VGL emulation):** Select Dataprocessing.
  (See page 174 for the IGP/VGL Configuration Menu, and see page 178 for a written description of Print Quality.)

OpenPrint Postscript/PDF Emulations

The printer has been configured at the Factory for optimal print quality through the Resolution configuration parameter (Postscript/PDF menu). However, users can reduce the horizontal, vertical, or both DPI values of this menu to increase printer speed. The downside of using a lower DPI value is as follows:

- Print quality is reduced and it can be difficult to read small characters.
- Barcodes may not get detected and optimized (barcodes are not searched for DPI values less than 120).

Users are encouraged to use the Resolution menu to find the right combination of Print Quality, Barcode Optimization, and Print Speed.
Dynamic Menu Options

The main menus for each of the different firmware types have several footnotes based on the possible options installed with the printer. This includes HOST IO connectivity, various hardware/mechanical options, and software emulations and features. The P8000 products dynamically detect options installed and only include relevant menus for the user to configure. The following is a description of the types of installation options and their effect on the main menu:

- **HOST INTERFACE**: Ethernet related menus are only present when the hardware is installed/enabled.
- **NETWORK SETUP**: The NETWORK SETUP menu is only present when Ethernet is installed.
- **Centronics and IEEE 1284**: Options are only selectable or configurable when the optional parallel interface card is present.
- **SureStak Power Stacker**: The power stacker and auto elevator options are available for configuration when the SureStak power stacker is installed.
- **QUICK SETUP**: This menu is a collection of popular menus to help users quickly configure the printer. It is also affected by the installed options.
Active Emulations

The emulations present in the printer are based on the firmware installed and the emulation options included. Both are configured from the Factory and do not require any action from the user.

IMPORTANT

Be sure to know which type of firmware and options are purchased (see Table 3) to understand the ACTIVE IGP EMUL, ACTIVE EMULATION, and EMULATION main menus. H-Series products only have the LinePrinter+ emulation.

Table 3. Available Firmware Types and Options

1 If installed
2 If PGL is selected from the ACTIVE EMULATION menu.
3 If VGL is selected from the ACTIVE EMULATION menu.
4 If LP+ is selected from the ACTIVE EMULATION menu.
5 If Postscript/PDF is selected from the ACTIVE EMULATION menu.
6 Available for Zero Tear Pedestal printers only.
7 Available for 1000 lpm printers only.
8 Available for pedestal printers only.
9 Available for 1000 lpm printers only.
**QUICK SETUP Menu**

When the printer is in offline mode, QUICK SETUP is the first Main Menu option that appears on the control panel. The QUICK SETUP menu offers basic menu items required to configure your printer. This section describes the options within the QUICK SETUP menu.

**NOTE:** The options in your menu will vary depending on the firmware, host IO, emulations selected, and other features available with your printer.

**Active Host**

The Active Host menu enables you to select and configure interfaces between the printer and your host computer. The Auto Switching option (factory default) allows all ports to be active at the same time.

**ZTP DataTime**

This option sets the pause time in the data stream that the ZTP requires before moving the form to the tear bar once a print job is completed. The values range from .5 to 5 seconds. The default is .5 seconds.

**ZTP WaitTime**

This option sets the minimum amount of time that the form stays at the tear bar. This allows you time to remove the form before the form is retracted to print the next form. The adjustable values range from 500 to 5000 milliseconds in increments of 500 milliseconds. The default value is 2 seconds.

**ZTP TearDist**

This option sets the tear off distance from the current print position to the tear bar. Adjustable values in increments of 1/144th of an inch range from 200 to 2880. The up and down arrows adjust the display value. When you press the ENTER key, the selected value is stored and a scale is printed to indicate the current tear off position. The default value is 1060.

**NOTE:** When a new value is selected, the printer will lose the current print position. You must reset the top of form to automatically save the new value.

**DBCS CPI (H-Series)**

Defines the default values for horizontal character spacing in DBCS mode. For the Hanzi and Kanji LP+ printer, select from 5.0, 6.0, 6.7, 7.5, and Others CPI. For the Hangul LP+ printer, selected from 5.0, 6.0, 6.7, 7.5, 8.5, 10, and others CPI.

The factory default for the Hanzi LP+ printer is 6.7 cpi. The factory default for the Hangul LP+ printer is 6.0 cpi. The factory default for the Kanji LP+ printer is 7.5 cpi.
**DBCS/ASCII Mode (H-Series)**

This option specifies the operating mode of the Hanzi printer. If set to DBCS mode, the printer can print double-byte characters and a limited number of single-byte characters. Otherwise, the printer can only print single-byte characters.

Available for the Hanzi and Kanji LP+ printers only.

**DBCS ASCII Style (H-Series)**

This option specifies the appearance of the single-byte numeric characters. For the Hanzi and Kanji LP+ printer, select from Normal, Oversize and OCRB. For the Hangul LP+ printer, select from Normal, and OCRB.

If set to Oversize, the numeric characters will appear larger than other single-byte characters. For example, the appearance of character "8" will be changed to "8". If set to OCRB, the numeric characters will print in OCRB style.

**Graphics Spd-Up (H-Series)**

This menu is used to increase (speed up) graphic printing speed by turning on Enhanced/Turbo mode.

- **Normal** (factory default). The printer prints at the given input graphics resolution.
- **Enhanced**. The printer provides first-level speed up, which means the speed is faster than Normal mode.
- **Turbo**. The printer provides second-level speed up, which means the printer is faster than Enhanced mode.
- **Match Typeface**. The input 180 x 180 dpi graphics resolution will drop-dot to the resolution matching the typeface selected.

**Typeface (H-Series)**

Sets the typeface of the printer. This key requires confirmation with the ENTER key.

The factory default for the Hanzi GB and Kanji SJIS LP+ is Near LQ.
The factory default for the Hangul and Hanzi Big5 LP+ is LQ.

**Active Emulation**

The Active Emulation menu enables you to select a combination of emulations as described in Table 3 on page 65.

**Active IGP Emulation**

The Active IGP Emulation menu enables you to activate either the PGL or VGL emulation. This menu is only available with the P8000 Standard and TN firmware as described in Table 3 on page 65.
PGL SFCC
You can specify which hex code (1-FF) will be used as the Special Function Control Character (SFCC). The SFCC denotes that the following data is an IGP command.

- **7E** (factory default)
- **1 – FF**

VGL SFCC
You can specify which hex code (1-FF) will be used as the Special Function Control Character (SFCC). The SFCC denotes that the following data is an IGP command.

- **5E** (factory default)
- **1 – FF**

Active Protocol
Select the LinePrinter+ protocol you wish to use. Refer to the *LinePrinter Plus Programmer's Reference Manual* for more information.

Form Length
Form length is the number of lines that can be printed on a page. You can set the form length in inches, millimeters (mm), or as a function of the current lpi (lines per inch).

Form Width
The form width can be specified in inches, millimeters, or as a function of the current cpi (characters per inch). The forms width set should not exceed the actual paper width.

Select CPI
This parameter allows you to specify the characters per inch (cpi) values. The options are 10.0, 12.0, 13.3, 15.0, 17.1, and 20.0. The factory default is 10.0 CPI.

Select LPI
This parameter allows you to specify the lines per inch (lpi) values.

- **ASCII**: The options are 6.0, 8.0, 9.0 and 10.3 LPI. The factory default is 6.0 LPI.
- **H-Series**: The options are 6.0 or 8.0 LPI. The factory default for the Hanzi and Hangul LP+ is 6.0. The factory default for Kanji LP+ is 8.0.
P-Series SFCC

This parameter allows you to select which ASCII codes will function as the Special Function Control Code (SFCC) command delimiter. P-Series codes can use hex 00 through hex 7F. Options include the following:

- **SOH (hex 01)** (factory default)
- **ESC (hex 1B)**
- **ETX (hex 03)**
- **CIRCUMFLEX (hex 5E)** – also called caret (^)
- **TILDE (hex 7E)** – (~)

**NOTE:** SOH, ETX, and ESC are non-printables. The characters (^) and (~) are printable; however, do not use them as printables in the host data stream if either is chosen as a delimiter because print errors will occur.

Margins

- **Left Margin.** Set in columns. Column zero is defined as the far left edge of the page, and column numbering increments from left to right.
- **Right Margin.** Set in columns. Column zero is defined as the far right edge of the page, and column numbering increments from right to left.
- **Top Margin.** Defined in lines, starting from line zero at the top of the page and incrementing from the top down.
- **Bottom Margin.** Defined in lines, starting from line zero at the bottom of the page and incrementing from the bottom up.

Form Length

Form length is the number of lines that can be printed on a page. You can set the form length in inches, millimeters (mm), or as a function of the current lpi (lines per inch).

Form Width

The form width can be specified in inches, millimeters, or as a function of the current cpi (characters per inch). The forms width set should not exceed the actual paper width.
Vert Forms (LG)

- **Bot Frm 66/6** (factory default). This option sets the bottom margin for the forms. You must specify the bottom margin in lines (at 6 lines per inch), ranging from 0 to 198 lines (33 inches). The default setting is 66. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. Selecting a value for this option resets the top margin to 0, so the top margin must be redefined after this option is selected.

- **Top Mrg 6/0**. This option sets the top margin for the forms. You must specify the top margin in lines (at 6 lines per inch), ranging from 0 to 198 lines (33 inches). The default setting is 0. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. The margins will automatically adjust so that the top and bottom margins do not cross each other.

Horiz Forms (LG)

- **Left Mgr 0.00** (factory default). This sets the left margin for the forms. You must specify the left margin in 1/10 inch increments, from 0 to 13.1 inches. The default value is 0. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. The margins will automatically adjust so that the left and right margins do not cross each other.

- **Right Mrg 13.2**. This sets the right margin for the forms. You must specify the right margin in 1/10 inch increments, from 0.1 to 13.2 inches. The default value is 13.2. Press NEXT to increase the value, PREV to decrease the value, and ENTER to change units. The margins will automatically adjust so that the left and right margins do not cross each other.

Page Length Rep (PCL-II)

- **Inches/Page** (factory default). Allows the user to set the page length in inches.

- **Lines/Page**. Allows the user to set the page length in number of lines.

Max Line Width (PCL-II)
Set the maximum line width at either 13.2 inches or the maximum width of the printer.

LPI Adjust (PCL-II)
Set the lines per inch value for the PCL-II emulation.
Resolution (OpenPrint)

This parameter defines the default print resolution. This selection is used when either the print resolution is not defined by the data stream or if the print resolution defined by the data stream is not supported.

The following resolutions are available on OpenPrint P8000 Standard:

- 120x144 DPI (factory default)
- 90 x 96 DPI

The following resolutions are available on OpenPrint P8000 HD:

- 180x180 DPI (factory default)
- 180x90 DPI
- 90x180 DPI
- 120x120 DPI
- 90x90 DPI

Paper Size (OpenPrint)

This parameter allows selection of available paper sizes. Available options include:

- **Custom.** Sets a user-defined paper size.
  - **Width.** Defines the paper width. The range is 1" to 15" in 0.1 inch increments. The default is 13.6 inches.
  - **Length.** Defines the paper length. The default is 11 inches. Three length options are available:
    - **Inches.** Defines the length in inches. The range is 1" to 24" in 0.1 inch increments.
    - **1/6 Inch Lines.** Defines the length in 1/6 inch lines. The range is 6 to 144 lines.
    - **1/8 Inch Lines.** Defines the length in 1/8 inch lines. The range is 8 to 192 lines.

To set a custom length, use the appropriate menu that allows for selection of the exact paper length to avoid loss of top-of-form (i.e., if using a 12" paper, select either the “Inches” menu set to 12” or the “1/6 Inch Lines” menu set to 72. However, if using a 11 2/3 inch paper length, the “1/6 Inch Lines” menu must be used (set to 70) since that is exactly 11 2/3 inches. If the “Inches” menu is used, the closest values would be 11.6 or 11.7 inches which are not exact.

The printer will indicate which of the three length menus was used by showing that submenu first when entering the “Length” menu. The configuration printout will also show the length menu used.
• See Table 4 for paper size options and actual sizes.

</table>

### Ribbon End Point

This parameter adjusts the point at which the system will declare the ribbon as being expended. The life count will always be from 100% to 0%, but if a darker setting is selected 0% will be reached more quickly. If a lighter setting is selected, the system will extend the time it takes to reach 0%.

### Load Config.

The printer can store numerous configurations in memory. This parameter allows you to select and load a specific configuration.
Save Config

This option allows you to save up to eight configurations to meet different print job requirements. This eliminates the need to change the parameter settings for each new job. The configurations are stored in memory and will not be lost if you turn off the printer. If the Protect Configs. parameter is enabled, the new configuration will not be saved unless the existing configuration has been deleted first. The factory default configuration cannot be changed. See “Saving Your New Configuration” on page 57 for details.

Power Up Config

This option allows you to specify which of the nine configurations (Factory or 1-8) will be the power-up configuration.
The CONFIG. CONTROL menu allows you to control your printer’s configurations according to the specifications necessary for your print jobs.

Load Config.

The printer can store numerous configurations in memory. This parameter allows you to select and load a specific configuration.

Save Config.

This option allows you to save up to eight configurations to meet different print job requirements. This eliminates the need to change the parameter settings for each new job. The configurations are stored in memory and will not be lost if you turn off the printer. If the Protect Configs. parameter is enabled, the new configuration will not be saved unless the existing configuration has been deleted first. The factory default configuration cannot be changed. See “Saving Your New Configuration” on page 57 for details.

Print Config.

This option is used to print a listing of various stored printer configurations. Store printouts of your configurations in a safe place for quick referral.
Delete Config.
You can delete one or all of your eight customized configurations. The factory default configuration cannot be deleted.

Power-Up Config.
You can specify which of the nine configurations (Factory or 1-8) will be the power-up configuration.

Protect Configs.
You can specify whether or not a new configuration should overwrite an existing configuration when you activate the Save Configs. parameter. When disabled (factory default), the new configuration will overwrite the existing configuration. When enabled, the new configuration will not overwrite the existing configuration, and the message “CONFIG. EXISTS / Delete First” displays.

Name Configs
This option allows you to rename any of the eight different configurations.
You may specify a 15-character name which can be used to refer to a configuration. The name you enter for a configuration will be used in the Load Config., Save Config., Print Config., Delete Config., and Power-Up Config. menus. The name can only be cleared by using the Reset Cfg Names menu. See example 2 on page 60 on how to name configurations.

Reset Cfg Names
You can reset specific configuration names back to the default value of the configuration number.

Auto Save
- Enable (factory default). When a change has been made to a Config. menu, this option automatically prompts the user to save or not save the change to a Config #.

  If you are currently in the Factory Config. menus and make a change, pressing ENTER saves to Config 1 or the next available Config. and becomes the Power-Up Config. If the Current Config is Config 1 and a menu change is made, pressing ENTER will save the change to Config 1.

- Disable. The printer will not prompt you to save any changes made.
The Host Interface Menu enables you to select and configure one of many types of interfaces between the printer and your host computer. The currently selected interface is indicated with an asterisk on the control panel message display. Each interface has its own submenu with a set of interface parameters which can be configured.

**IMPORTANT**

When set to Auto Switching, the printer will load the power-up configuration and the new interface parameters. Any settings made and not saved before selecting these interfaces will be lost.
Auto Switching gives the printer the ability to handle multiple data streams sequentially. With Auto Switching, the printer can service hosts attached to the serial, parallel, USB, and Ethernet ports as if they were the only interface connected.

For example, if the host computer sends one print job to the RS-232 serial port and a separate print job to the IEEE 1284 parallel port, the printer's Auto Switching is able to handle both jobs, in the order they were received. The user does not have to reconfigure the selected interface between jobs.

**Port Type**

Select the parallel interface type connected to the printer. For example, if your printer is attached to one host with a Centronics connection, you would select Centronics under the Parallel Hotport menu.
Auto Switching Submenu

Trickle Time

When the printer is printing data from a host and a second job is received by the printer from a different host, Trickle Time prevents the second host from timing out while it is waiting for its data to be printed. In order to support this feature, the port has to be able to accept data from the host and store it for future use.

For example, if the printer is printing a job from the serial port, and then receives a second print job from the parallel or USB port, the data from the parallel or USB port will “trickle” bit by bit into the printer buffer to prevent a timeout error from being sent back to the host connected to the parallel port.

The selected value is the time that the printer waits before getting the next byte of data from the host. The Trickle Time value should be less than the host time out value, but not too much shorter or else the printer fills up its buffer too fast.

Timeout

This is the value used by the printer to time out from the current port and check the other selected port types for data to print. When the printer has not received data from the host after a certain period of time, it needs to timeout in order to service the other ports.

Report Status

- **Disable** (factory default). When a fault occurs on the printer, only the active port reports the fault to the host.
- **Enable**. The port will report any fault even when it is not the current active port.

Switch Out On

**NOTE:** This option is only available under Ethernet Hotport.

- **Data Timeout** (factory default). Allows Autoswitching when no data has been received for the selected Time Out period.
- **Session Close**. Allows Autoswitching only when the Network Socket is closed. If the Ethernet option is not installed the Network Socket is always reported as closed and this menu option is ignored.
IEEE 1284 Parallel (Bidirectional) Submenu

The IEEE 1284 interface is faster and more versatile than Centronics and supports bidirectional communication. Configuration of this interface is controlled from the host. Refer to “IEEE 1284 Parallel Interface” on page 236 for more details about the available modes (Compatibility, Nibble, and Byte).

Prime Signal
- **Enable** (factory default). The parallel port will perform a warm start (reboot) if the host asserts the prime signal.
- **Disable**. The parallel port will not perform a warm start (reboot) if the host asserts the prime signal.

TOF Action
- **Reset** (factory default). A form feed is performed before a warm start when the prime signal is asserted from the host. This setting is used only if the prime signal parameter is enabled.
- **Do Nothing**. Nothing occurs before a warm start when the prime signal is asserted from the host.

Buffer Size in K
This option configures the amount of memory allocated for the IEEE 1284 parallel port buffer. You can specify between 1 and 16 Kbytes, in 1-Kbyte increments. The default is 16K.

**NOTE:** H-Series and OpenPrint HD products have a range of 1 to 256 and a default of 64K.

\* = Factory Default

1 OpenPrint HD and H-Series products have an extended range to 256 with a default of 64.

2 Not available on LG or PCL-2 products.
Auto Trickle

Auto Trickle is used to prevent a host computer from timing out because the parallel interface was busy for too long. When Auto Trickle is enabled and the printer's buffers are almost full, the printer will begin to trickle data in (at the rate set in the Trickle Time menu) until the buffers start to empty.

Trickle Time

When the printer is printing data from a host and a second job is received by the printer from a different host, Trickle Time prevents the second host from timing out while it is waiting for its data to be printed. In order to support this feature, the port has to be able to accept data from the host and store it for future use.

For example, if the printer is printing a job from the serial port, and then receives a second print job from the parallel port, the data from the parallel port will "trickle" bit by bit into the printer buffer to prevent a timeout error from being sent back to the host connected to the parallel port.

The selected value is the time that the printer waits before getting the next byte of data from the host. The Trickle Time value should be less than the host timeout value, but not too much shorter or else the printer fills up its buffer too fast.

Offline Process

- **Disable** (factory default). When set to disable, the printer does not process parallel data while offline.
- **Enable**. When set to enable, the printer continues to process (but not print) the current parallel job while the printer is offline until the printer's buffer is full.

* = Factory Default

1 OpenPrint HD and H-Series products have an extended range to 256 with a default of 64.

### Data Bit 8
- **Enable** (factory default). Allows access to the extended ASCII character set.
- **Disable**. The printer interprets bit 8 of each incoming data character as a zero, regardless of its actual setting.

### PI Ignored
The PI (Paper Instruction) signal is used to control vertical paper motion.
- **Enable** (factory default). Ignores the PI signal and treats the data as characters or control codes.
- **Disable**. Causes the printer to interpret the eight data lines as VFU commands when the PI signal is true.

### Data Polarity
The Data Polarity parameter must be set to match the data polarity of your host computer.
- **Standard** (factory default). Does not expect the host computer to invert the data.
- **Inverted**. Expects the data received on the data lines from the host computer to be inverted. Ones become zeros, and vice versa.
Resp. Polarity
The Resp. Polarity parameter must be set to match the response polarity of your host computer.

- **Standard** (factory default). Does not invert the response signal.
- **Inverted**. Inverts the response signal sent to the host computer.

Busy On Strobe
- **Enable** (factory default). Asserts a busy signal after each character is received.
- **Disable**. Asserts a busy signal only when the print buffers are full.

Latch Data On
Specifies whether the data is read on the leading or trailing edge of the data strobe signal. The default is leading.

Prime Signal
- **Enable** (factory default). The parallel port will perform a warm start (reboot) if the host asserts the prime signal.
- **Disable**. The parallel port will not perform a warm start (reboot) if the host asserts the prime signal.

TOF Action
- **Reset** (factory default). A form feed is performed before a warm start when the prime signal is asserted from the host. This setting is used only if the prime signal parameter is enabled.
- **Do Nothing**. Nothing occurs before a warm start when the prime signal is asserted from the host.

Buffer Size in K
Configures the amount of memory allocated for the Centronics parallel port buffer. You can specify between 1 and 16 Kbytes, in 1-Kbyte increments. The default is 16K.

**NOTE:** H-Series and OpenPrint HD products have a range of 1 to 256 and a default of 64K.

Auto Trickle
Auto Trickle is used to prevent a host computer from timing out because the parallel interface was busy for too long. When Auto Trickle is enabled and the printer's buffers are almost full, the printer will begin to trickle data in (at the rate set in the Trickle Time menu) until the buffers start to empty out.
**Trickle Time**

When the printer is printing data from a host and a second job is received by the printer from a different host, Trickle Time prevents the second host from timing out while it is waiting for its data to be printed. In order to support this feature, the port has to be able to accept data from the host and store it for future use.

For example, if the printer is printing a job from the serial port, and then receives a second print job from the parallel or USB port, the data from the parallel or USB port will “trickle” bit by bit into the printer buffer to prevent a timeout error from being sent back to the host connected to the parallel port.

The selected value is the time that the printer waits before getting the next byte of data from the host. The Trickle Time value should be less than the host timeout value, but not too much shorter or else the printer fills up its buffer too fast.

* = Factory Default

1. OpenPrint HD products have an extended range to 256.
2. H-Series and OpenPrint HD products have an extended range to 256 with a default setting of 64.
Data Protocol

You can select one of the following serial interface protocols to meet the host interface requirements.

• **XON / XOFF** (factory default). The printer controls the flow of communication from the host by turning the transmission on and off. In some situations, such as when the buffer is full or the timing of signals is too slow or too fast, the printer will tell the host to stop transmission by sending an XOFF character. An XOFF character is sent when the number of empty bytes in the buffer is less than or equal to 25 percent of the buffer size. If the host keeps sending data after an XOFF is sent, the printer firmware will continue to send an XOFF for every 16 characters received. When cleared, the printer will resume receiving data (XON). The data does not have any End of Text codes; XON / XOFF is a non-block protocol.

• **ETX / ACK**. End of Text / Acknowledge. The host controls the flow of communication to the printer by sending a block of data and ending the block with an End of Text (ETX) signal. When the printer receives the ETX signal, it will acknowledge the ETX, thereby acknowledging it has received the entire block of data.

• **ACK / NAK**. ACK means acknowledge; the device acknowledges it has accepted a transmission. NAK means negative acknowledge; the device did not receive the transmission.

• **SERIES1 1 CHAR**. The printer controls the flow of communication from the host by turning the transmission on and off using response characters sent to the host. If the number of valid bytes in the buffer reaches 75 percent of the buffer size, the online or offline and buffer full response character is sent. If the buffer is completely full, an online or offline buffer full response is sent every time a character is sent from the host. Whenever the printer state changes to online or offline, the appropriate response character is sent. If the idle response option is enabled, the printer will send a response character every two seconds while the number of valid bytes in the buffer is less than 75 percent of the buffer size. If a poll character is received (configurable from the Poll Character xx Hex option on the front panel from hex 0 through FF), the printer will send a response character \( n \) milliseconds later (configurable from the Poll Character xx MS on the front panel from 0 through 30). This \( n \) milliseconds is called the poll delay. The poll character will be removed from the input data stream and will not be processed. This may cause problems with the transmission of binary data (e.g., control codes, bit image, etc.). If a poll delay is started due to the receipt of a poll character and another poll character is received, the second poll character has no effect and is removed from the input data stream. If a transition (from buffer full to empty or online to offline) occurs during a poll delay, the new printer state will be sent at the end of the poll delay.
The response characters are described in Table 5.

### Table 5. Series1 1 Char Response Characters

<table>
<thead>
<tr>
<th>Printer State</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online and Buffer Empty</td>
<td>CR</td>
</tr>
<tr>
<td>Online and Buffer Full</td>
<td>3</td>
</tr>
<tr>
<td>Offline and Buffer Empty</td>
<td>0</td>
</tr>
<tr>
<td>Offline and Buffer Full</td>
<td>2</td>
</tr>
</tbody>
</table>

- **SERIES1 2 CHAR.** This protocol behaves exactly the same as the Series1 Char except there is a two-character response to the host. The response characters are described in Table 6.

### Table 6. Series1 2 Char Response Characters

<table>
<thead>
<tr>
<th>Printer State</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online and Buffer Empty</td>
<td>1 CR</td>
</tr>
<tr>
<td>Online and Buffer Full</td>
<td>3 CR</td>
</tr>
<tr>
<td>Offline and Buffer Empty</td>
<td>0 CR</td>
</tr>
<tr>
<td>Offline and Buffer Full</td>
<td>2 CR</td>
</tr>
</tbody>
</table>

- **ENQ/ACK.** Enquiry/Acknowledge. The host controls the flow of data by sending an ENQ (Enquiry, decimal 5, Control-E) approximately every 80 characters. When the printer is ready for more data, it replies with an ACK (Acknowledge, decimal 6, Control-F).

- **DTR.** The printer controls the data flow by sending this hardware signal to the host. If there is enough room in the printer buffer, the printer will send a high signal; if the buffer is full, the printer will send a low signal. DTR tells the host if it is safe to send more data. (If the host sends data during an unsafe condition, data will be lost.)

### Baud Rate

Sets the baud rate of the serial interface in the printer. Baud rate is the speed at which serial data is transferred between the host computer and the printer. The choices for the RS-232 interface are 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200 Baud. The default is 9600 Baud.

**NOTE:** If you select a baud rate that is greater than 19200, you may also want to increase the Buffer Size in K parameter to improve performance.
Word Length
Sets the length of the serial data word. The length of the data word can be set to 7 or 8 bits, and must match the corresponding data bits setting in the host computer.

Stop Bits 1
Sets the number of stop bits in the serial data word. Either one or two stop bits can be selected. The setting must match the corresponding stop bit setting in the host computer.

Parity
Set for odd parity, even parity, mark, sense, or no parity. The setting must match the corresponding parity setting in the host computer.

Data Term Ready
This configuration is part of hardware flow control and determines when the Data Terminal Ready (DTR) signal is generated. This signal indicates if the printer is ready to receive data.

- **True** (factory default). Continuously asserts the DTR signal.
- **On Line and BNF (buffer not full)**. Asserts the DTR signal when the printer is online and the internal serial buffer is not full.
- **Off Line or BF (buffer full)**. Asserts the DTR signal when the printer is offline or the internal serial buffer is full.
- **On Line**. Asserts the DTR signal when the printer is online.
- **False**. Never asserts the DTR signal.

Request To Send
This configuration is part of hardware flow control and determines when the Request to Send (RTS) signal is generated. This signal indicates whether or not the printer is ready to receive data.

- **On Line and BNF** (factory default). Asserts the RTS signal when the printer is online and the internal serial buffer is not full.
- **Off Line or BF**. Asserts the RTS signal when the printer is offline or the internal serial buffer is full.
- **On Line**. Asserts the RTS signal when the printer is online.
- **False**. Never asserts the RTS signal.
- **True**. Continuously asserts the RTS signal.
Buffer Size in K

This option configures the amount of memory allocated for the serial port buffer. You may specify between 1 and 16 Kbytes, in 1-Kbyte increments. The default is 16K.

**NOTE:**
1. If you select a baud rate that is 19200 or greater, you may want to increase the Buffer Size in K parameter to improve performance.
2. H-Series and OpenPrint HD products have a range of 1 to 256 and a default of 64K.

Poll Character

This option is for the Series1 protocol. Whenever the printer receives this character, it sends a response to the host indicating the current state of the printer (see Series1 protocol). It may be configured from 0 through FF hexadecimal.

Poll Response

This option is for the Series1 protocol. After receiving a poll character, the printer will wait the poll response time in milliseconds before sending the response. It may be configured from 0 through 30.

Idle Response

This option is for the Series1 protocol.

- **Disable** (factory default)
- **Enable**. The printer will send a response character every two seconds while the number of valid bytes in the buffer is less than 75 percent of the buffer size.

One Char Enquiry

The One Char Enquiry mode uses the Poll Character to detect a request from the host and sends a response back to the host. This option also allows you to turn on and off this feature.

<table>
<thead>
<tr>
<th>Printer State</th>
<th>Response (hex)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online and Buffer Not Full</td>
<td>22</td>
</tr>
<tr>
<td>Online and Buffer Full</td>
<td>23</td>
</tr>
<tr>
<td>Offline and Buffer Not Full</td>
<td>20</td>
</tr>
<tr>
<td>Offline and Buffer Full</td>
<td>21</td>
</tr>
</tbody>
</table>

The Poll Character is removed from the data stream. If the Data Protocol is set to ETX/ACK, ACK/NAK, or Series 1, One Char Enquiry is automatically disabled.
Framing Errors
Possible errors that can occur when the printer’s serial interface settings do not match those of the host computer.

- **Enable** (factory default). If a framing error occurs, a fault message will display on the control panel.
- **Disable**. If a framing error occurs, a fault message will not display on the control panel.

Offline Process

- **Disable** (factory default). When set to disable, the printer does not process serial data while in offline mode.
- **Enable**. When set to enable, the printer continues to process without printing the current serial job while the printer is offline until the printer’s buffer is full.

**NETWORK SETUP Menu**

**Ethernet Address**

- **Ethernet Address** (from page 97)
- **IP Address**
- **Subnet Mask**
- **Gateway Address**
- **MAC Address**
- **IP Assignment**

* = Factory Default

1 Only if the Integrated Ethernet feature is installed.
IP Address
A numeric address such as 123.45.61.23 which identifies a printer or server in a LAN or WAN.

Subnet Mask
A binary value used to divide IP networks into smaller subnetworks or subnets. This mask is used to help determine whether IP packets need to be forwarded to other subnets.

Gateway Address
A gateway address is the IP address of a hardware device (gateway) that translates data between two incompatible networks, which can include protocol translation.

MAC Address
This menu item is the Manufacturer’s Assigned Number, and is unique for each printer. It is read-only.

IP Assignment
This menu provides two options to control IP Assignment: DHCP and BootP.

- **DHCP.** You can enable/disable the DHCP protocol using this option, but consult your administrator for the appropriate setting. Options include Disable and Enable (factory default).

- **BootP.** You can enable/disable the BootP protocol using this option, but consult your administrator for the appropriate setting. Options include Disable (factory default) and Enable.
The Ethernet Params menu helps your printer communicate on a network.

For information on assigning the IP Address, Gateway Address, Subnet Mask, and MAC Address, refer to the *Network Interface Card User's Manual*.

**ASCII Data Port**

This option sets the port number for ASCII print jobs. The data port number needs to match your host system setting.

- **9100** (factory default)
- **1025 - 65535**

**IPDS Data Port**

This option allows you to set the port number for IPDS print jobs only if the IPDS option is installed.

- **5001** (factory default)
- **1025 - 65535**

**Keep Alive Timer**

This is the time that the Keep Alive Timer will run. With the Keep Alive Timer on, the tcp connection will stay connected even after the print job has terminated.

- **3 Minutes** (factory default)
- **0 - 10 Minutes**
Ethernet Speed

This menu option only appears if a 10/100Base-T network interface card (NIC) is installed. The Ethernet Speed menu allows compatibility with different systems and networks. The factory default is Auto Select.

- **Auto Select**. (factory default) This setting tells the 10/100Base-T NIC to perform an auto detection scheme and configure itself to be 10 Half Duplex, 10 Full Duplex, 100 Half Duplex, or 100 Full Duplex.

- **10 Half Duplex**. Tells the 10/100Base-T NIC to communicate at 10 Megabits per second using half duplex.

- **10 Full Duplex**. Tells the 10/100Base-T NIC to communicate at 10 Megabits per second using full duplex.

- **100 Half Duplex**. Tells the 10/100Base-T NIC to communicate at 100 Megabits per second using half duplex.

- **100 Full Duplex**. Tells the 10/100Base-T NIC to communicate at 100 Megabits per second using full duplex.

Job Control

The job control mode has four options:

- **Standard** (factory default). The NIC waits for the printer to finish receiving the current job before sending another job. The status line shows “done” when the job is completely received by the NIC.

- **Enhanced**. The NIC waits for the printer to finish receiving the current job before sending another job. The status line shows “done” when the job is fully printed.

- **Off**. No job synchronization between the NIC and the printer.

- **Fast Standard**. The EOJ (End of Job) packet is acknowledged immediately. Use this selection if the job is timed out due to a delay in the acknowledgement of the EOJ packet because of the amount of data being printed.

**NOTE:** It is recommended to set this option to Enhanced if the emulation is Postscript.

Offline Process

- **Disable** (factory default). When set to disable, the printer does not network data while in offline mode.

- **Enable**. When set to enable, the printer continues to process without printing the current network job while the printer is offline until the printer’s buffer is full.
ACTIVE IGP EMUL and ACTIVE EMULATIONS

The emulation types present in the printer are based on the firmware installed and the emulation options included. Both are configured from the Factory and do not require any action from the user.

**IMPORTANT** Be sure to know which type of firmware and options are purchased (see Table 3) to understand the ACTIVE IGP EMUL, ACTIVE EMULATION, and EMULATION main menus. The H-Series printers only have the LinePrinter+ emulation.

This ACTIVE IGP EMUL and ACTIVE EMULATION function allows you to activate the desired emulation. There are two methods for selecting the desired emulation. The first is by selecting the emulation directly from the printer menu. The second is by sending a host command which will switch the emulation automatically (see the appropriate Programmer’s Reference Manual for details).

When changing from one emulation to the other, the printer will load the power-up configuration and the new emulation parameters. Any configuration settings performed before selecting these emulations that are not saved in NVRAM will be lost.

<table>

**NOTE:**

* = Default Selection

¹ The Active IGP EMULATION menu is only available when the PGL/VGL option is installed.

² The ACTIVE EMULATION menu shows the options “IGP/PGL & LP+” and “IGP/VGL & LP+” when the PGL/VGL option is installed. Otherwise, “LinePrinter+” replaces the options.

³ The selections under the EMULATION menu is based on the ACTIVE IGP EMULATION or ACTIVE EMULATION settings with all Optional Emulations installed.
The EMULATION menu allows you to configure the emulation used with your printer. The Proprinter XL, Epson FX, P-Series, P-Series XQ, and Serial Matrix emulations are all part of ASCII LinePrinter+. The H-Series LinePrinter+ has a unique set of emulations such as LQ1600K, KS, and KSSM depending on the firmware type. You can configure options for the active emulation via the EMULATION menu. Emulation options are further described in their corresponding Programmer's Reference Manual.

The menus shown for the ASCII LinePrinter+, IGP/PGL, and IGP/VGL are specific to the Standard, ANSI, and TN firmware. These emulations may be structured differently for the PCL-II and LG Firmware. For PCL-II and LG Firmware, some of the character sets or options may not be available.

* = Factory Default
Translation Tbl
Prints out a table of the Coax interface’s current character set. This operation is valid only when the TN3270 interface is the current interface.

Active Char Set
Specifies which character language set will be the active set.
- Secondary Sets (factory default)
- Primary Sets

Prt Partial Line
- Enable (factory default). When this option is enabled, it forces the printer to print if a partial line is in the printer (i.e. line not ending with a LF).
- Disable. When disabled, the last partial line of data will not be printed.

Early Print Cmpl
Early Print Complete allows the printer to send Print Complete status to the host before the printer is actually done printing all data. Early Print Complete is only available if the IPDS feature is installed.
- Disable (factory default). Means the printer will suppress the Early Print Complete response until all printing is complete.
- Enable. Means the printer will send an acknowledgement to the host when it is able to accept more data.

NOTE: When an Early Print Complete is enabled and an error occurs, the data in the printer will remain in the buffer (regardless of the setting of the Cancel Buffer option). It is recommended that local procedures be followed to recover from the error.

Do not select Early Print Complete while a print job is in progress. If this is done you will need to restart the printer.

PTX Transparent
Lead-in Chars
You can enable additional printer features which are not accessible through standard TN3270 emulations. To access these features, send text commands in the data stream. The commands must have a start and end code. Four sets are available:
- Set 1. start code: <% (factory default)
  stop code: >
- Set 2. start code: __
  stop code: $
- Set 3. start code: __
  stop code: _
- User Defined.
Usr Defined HTRN

This option is used to set user defined lead-in characters. The range is ASCII character. This option allows users to define their own lead-in characters for the Printronix Specific commands. Select a hex value for the following codes for the User Defined option:

- **Start Code 1 5F** (factory default)
- **Start Code 2 5F**
- **Stop Code 5B**

Alt. Set 80-9F

- **Printable** (factory default). Prints data in the range of hex 80 through hex 9F.
- **Control Code**. Interprets data in the range of hex 80 through hex 9F as a control code.

Change Case

Specifies the font as Mono or Dual case. This option is available only in non-SCS mode. The host will be notified of the change when the printer is placed online. Mono Case prints the same as Dual Case if the character set is one of the following “right to left” sets: Katak., Hebrew, Old Hebrew, and Farsi.

SCS (System Network Architecture Character String) mode is controlled by the host computer.

- **Dual Case** (factory default)
- **Mono Case**

Set Text Orientn

Specifies the direction in which characters are printed on the page. This allows the printer to print languages which are printed right to left instead of left to right.

- **Left to Right** (factory default).
- **Right to Left**. When a right to left language is selected, the host will be notified of print direction changes when the printer is put online.

Intervention Req

Select from the following:

- **Send To Host** (factory default). The printer sends a signal to the host computer when any of the following occur:
  - Printer faults occur.
  - Hold mode time-out occurs.
- **Not Send To Host**

If not selected, the printer will only send the signal on printer faults that cause data loss (paper jam, ribbon stall, online platen open, etc.).
Compatibility Op

The Compatibility Options allow you to select special printer functions in the non-SCS mode based on the capabilities of the printer emulated.

CR At MPP+1

MPP is Maximum Print Position, which is also known as line length. This option controls a carriage return at the end of a print line and at MPP+1.

- **On** (factory default). Produces a carriage return to the first print position of the next line.
- **Off**. Produces a carriage return to the first print position of the current line.

NL At MPP+1

Controls how many lines are skipped when the carriage returns to a new line.

- **On** (factory default). Moves to the first print position two lines down from the current position.
- **Off**. Moves to the first print position of the next print line.

Position Aft FF (4234 only)

Allows you to select the location of the print position after a form feed command is sent.

- **On**. Sets the printer to print at print position 1 of the first print line on the next form.
- **Off** (factory default). Sets the printer to print at print position 2 of the first print line on the next form.

Last Char = FF

Determines the print line position when a form feed command is the last code encountered in the print buffer.

- **On** (factory default). Moves to the first print position on the second line of the next form.
- **Off**. Moves to the first print position on the first line of the next form.

**NOTE:** This option is ignored if Auto Skip At End is on.

If configured as a 3287, and a form feed occurs in the middle of a print buffer, the printer defaults to the first print position on the second line of the next form regardless of the setting of this option.

Null Suppression

- **Off** (factory default). Ignores nulls. The print position does not move.
- **On**. Treats nulls as blank spaces.
**FF Validity**

Determines if the position of a form feed command affects its execution.

- **Off** (factory default). Performs a form feed only if it occurs at the first print position in a line or at Maximum Print Position +1. A form feed command at any other position is recognized as a space.
- **On**. Allows the printer to perform a form feed command anywhere in the data stream.

**Auto Skip At End**

Specifies whether or not to perform an automatic form feed at the end of a print buffer. If form feed is the last character in the print order, the form feed function is supplied by the Auto Skip At End option.

- **Off** (factory default). Sets the printer to print at print position 1 of the next line.
- **On**. Sets the printer to print at print position 1 of the first line of the next form.

**FF After Job**

Determines the print position after an operator-initiated local copy (print screen function).

- **Off** (factory default). Performs an automatic new line command after completing a print buffer (unless a new line, form feed, or carriage return command was the last one executed). The printer is set to print at print position 1 of the next line.
- **On**. Performs an automatic form feed command unless a form feed was the last one executed. The printer is set to print at print position 1 of the first line on the next form.

**CR, EM, and NL (3287 only)**

CR (Carriage Return), EM (Error Message), and NL (New Line) specify that the printer treat the CR, EM, and NL control codes either as spaces or as control codes.

- **On** (factory default). Treats the CR, EM, and NL commands as control codes.
- **Off**. Treats the CR, EM, and NL commands as spaces.
Host Override
Determines whether the printer accepts certain commands sent by the host, or continues to use the current operator panel settings.

- **Disable** (factory default). Allows these host commands to override operator panel settings: line length, forms length, lines per inch (LPI), characters per inch (CPI), print quality, and text orientation. Note the information appearing on the message display may not match the data stream setting. No values will change upon initial selection of the disable option.
- **Enable**. The operator panel settings override the host commands.

Format Control
Enables the printer to reflect the same spacing as CTPC model printers after absolute and relative move commands are executed.

- **Disable** (factory default). Reflects distance, generated by the VGL feature, PGL feature, and Hex Transparent control code sequence, in the new position (after horizontal and vertical tabs are executed).
- **Enable**.

Max. Print Width
Set the maximum print width the printer will print when using a C/T host interface. Set for 13.2 inches when printing files larger than the width of the printer. All data exceeding the width of the maximum Printer Width will be truncated.

- **13.2 inches** (factory default)
- **Printer Width** (the maximum width of the printer)

* = Factory Default
Translation Tbl
Prints out a table of the TN5250 interface's current character set. This operation is valid only when the TN5250 interface is the current interface.

Active Char Set
Selects which group of character sets (Primary or Secondary) will be active.
- Secondary Set (factory default)
- Primary Set

Prt Partial Line
- Enable (factory default). When this option is enabled, it forces the printer to print if a partial line is in the printer (i.e. line not ending with a LF).
- Disable. When disabled, the last partial line of data will not be printed.

PTX Transparent
Lead-in Chars
You can enable additional printer features which are not accessible through standard TN5250 emulations. To access these features, send text commands in the data stream. The commands must have a start and end code. Four sets are available:
- Set 1. start code: <% (factory default)  
  stop code: >
- Set 2. start code: ¬¬  
  stop code: $
- Set 3. start code: _%  
  stop code: _
- User Defined.

Usr Defined HTRN
This option is used to set user defined lead-in characters. The range is ASCII character. This option allows users to define their own lead-in characters for the Printronix Specific commands. Select a hex value for the following codes for the User Defined option:
- Start Code 1 5F (factory default)
- Start Code 2 5F
- Stop Code 5B

Alt. Set 80-9F
- Printable (factory default). Prints data in the range of hex 80 through hex 9F.
- Control Code. Interprets data in the range of hex 80 through hex 9F as a control code.
Graphic Chek Err

Allows overriding of the host setting for the SGEA (Set Graphic Error Action) command.

- **Enable** (factory default). The host setting for the SGEA used by the printer. If the SGEA command is requested to stop on graphic errors, the printer will stop when a graphic error is detected.
- **Disable**. Ignores the SGEA command from the host. The printer does not stop when an error is detected; instead, it substitutes the character selected in the Graphic Chek Code parameter.

Graphic Chek Cod

Specifies the replacement character to print in place of any unprintable character that is received from the host. Choose a hex character from 40 through FE. The character becomes the printer default when:

- The printer is powered off and then powered on.
- An SGEA command specifies to use the operator panel default.
- The Graphic Chek Err parameter is disabled.

The value can be the following:

- 60 (factory default)
- 40 – F4

Set Text Orientn

Specifies the direction in which characters are printed on the page. This allows the printer to print languages which are printed right to left instead of left to right.

- **Left to Right** (factory default)
- **Right to Left**. When a right to left language is selected, the host will be notified of print direction changes when the printer is put online.

Host Override

Determines whether the printer accepts certain commands sent by the host, or continues to use the current operator panel settings.

- **Disable** (factory default). Allows these host commands to override operator panel settings: line length, forms length, lines per inch (LPI), characters per inch (CPI), print quality, and text orientation. Note the information appearing on the message display may not match the data stream setting. No values will change upon initial selection of the disable option.
- **Enable**. The operator panel settings override the host commands.
**Format Control**

Enables the printer to reflect the same spacing as earlier generation line matrix printers after absolute and relative move commands are executed.

- **Disable** (factory default). Reflects distance, generated by the VGL feature, PGL feature, and Hex Transparent control code sequence, in the new position (after horizontal and vertical tabs are executed).
- **Enable**.

**Max. Print Width**

Set the maximum print width the printer will print when using an IBM host interface. Set for 13.2 inches when printing files larger than the width of the printer. All data exceeding the width of the maximum Printer Width will be truncated.

- 13.2 Inches (factory default)
- Printer Width (the maximum width of the printer)

Define CR Code

The Define CR Code option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends Line Feeds to the printer.

- **CR = CR.** Does not insert an extra Line Feed after each Carriage Return.
- **CR = CR + LF.** Inserts an extra Line Feed after each Carriage Return.

Auto LF

This option defines the printer actions when print data is received past the forms width setting.

- **Enable.** Performs an automatic carriage return and line feed when data is received past the forms width.
- **Disable.** Discards any data past the forms width.

Define LF Code

The Define LF Code option controls the action of the printer when it receives a Line Feed code (hex 0A) from the host computer. If this feature is enabled, each time the printer receives a Line Feed, it inserts an additional Carriage Return code (hex 0D) into the data stream. This feature can be used in most installations, but it is required if the host computer does not send Carriage Returns to the printer.

- **LF = CR + LF.** Adds an extra Carriage Return with each Line Feed.
- **LF = LF.** Does not add a Carriage Return with a Line Feed.

Printer Select

- **Disable.** Ignores the ASCII DC1 and DC3 control codes.
- **Enable.** Disables the printer when a DC1 control code is received, and enables the printer when a DC3 control code is received.

Character Set

This parameter selects a character set for the Epson® emulation.

20 CPI Condensed

Compressed print characters are narrower than the normal character set. This is helpful for applications for which you need to print the maximum amount of information on a page.

- **Enable.** Prints about 60 percent of the width of normal characters when compressed print is chosen by the host computer. For example, a 12 CPI Draft font will compress to 20 CPI.
- **Disable.** Does not compress print widths, even if condensed print is chosen by the host.
Alt. Set 80-9F

- **Control Code.** Interprets data in the range of hex 80 through hex 9F as a control code.
- **Printable.** Prints data in the range of hex 80 through hex 9F.

Currency Sign (for GB and Kanji)

- **RMB Select.** The ASCII code hex 24 is printed as a RMB “¥” character in DBCS mode. Default for GB.
- **$ Select.** The ASCII code hex 24 is printed as a dollar “$” character in DBCS mode. Default for Kanji.

AR3240 (for GB and Kanji)

- **Disable.** AR3240 emulation does not take effect. Default.
- **Enable.** AR3240 takes effect, SUB (0x1A) is used as another SFCC. The listed commands will take effect and turn the extending table character on.

KS Emulation

**Define CR Code**

The Define CR code option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends Line Feeds to the printer.

- **CR = CR**. Does not insert an extra Line Feed after each Carriage Return.
- **CR = CR + LF**. Inserts an extra Line Feed after each Carriage Return.

**CR Bold Select**

This option determines whether CR (0x0D) will turn on the bold attribute.

- **Enable**. The text after CR will be printed as bold together with the text before CR.
- **Disable**. Normal CR function.

---

KS Emulation

Alt Set 80-9F

Control Code

Printable

Emulation Extend

Disable

Enable
Auto LF
This option defines the printer actions when print data is received past the forms width setting.

- **Enable.** Performs an automatic carriage return and line feed when data is received past the forms width.
- **Disable.** Discards any data past the forms width.

Define LF Code
The Define LF code option controls the action of the printer when it receives a Line Feed code (hex 0A) from the host computer. If this feature is enabled, each time the printer receives a Line Feed, it inserts an additional Carriage Return code (hex 0D) into the data stream. This feature can be used in most installations, but it is required if the host computer does not send Carriage Returns to the printer.

- **LF = CR + LF.** Adds an extra Carriage Return with each Line Feed.
- **LF = LF.** Does not add a Carriage Return with a Line Feed.

Printer Select
- **Disable.** Ignores the ASCII DC1 and DC3 control codes.
- **Enable.** Disables the printer when a DC1 control code is received, and enables the printer when a DC3 control code is received.

Alt. Set 80-9F
- **Control Code.** Interprets data in the range of hex 80 through hex 9F as a control code.
- **Printable.** Prints data in the range of hex 80 through hex 9F.

Emulation Extend
- **Disable.** Does not select the extension command.
- **Enable.** Selects the extension command (ESC 4/ESC 5 to select/cancel Italic Printing and ESC SP to select Intercharacter Spacing).
KSSM Emulation

Character Sets
This parameter selects a character set for the KSSM emulation.

CR Bold Select
This option determines whether CR (0x0D) will turn on the bold attribute.
- **Enable.** The text after CR will be printed as bold together with the text before CR.
- **Disable.** Normal CR function.

Define CR Code
The Define CR code option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends Line Feeds to the printer.
- **CR = CR.** Does not insert an extra Line Feed after each Carriage Return.
- **CR = CR + LF.** Inserts an extra Line Feed after each Carriage Return.

Auto LF
This option defines the printer actions when print data is received past the forms width setting.

- **Enable.** Performs an automatic carriage return and line feed when data is received past the forms width.
- **Disable.** Discards any data past the forms width.

### Define LF Code

The Define LF code option controls the action of the printer when it receives a Line Feed code (hex 0A) from the host computer. If this feature is enabled, each time the printer receives a Line Feed, it inserts an additional Carriage Return code (hex 0D) into the data stream. This feature can be used in most installations, but it is required if the host computer does not send Carriage Returns to the printer.

- **LF = CR + LF.** Adds an extra Carriage Return with each Line Feed.
- **LF = LF.** Does not add a Carriage Return with a Line Feed.

### Printer Select

- **Disable.** Ignores the ASCII DC1 and DC3 control codes.
- **Enable.** Disables the printer when a DC1 control code is received, and enables the printer when a DC3 control code is received.

### 20 CPI Condensed

Compressed print characters are narrower than the normal character set. This is helpful for applications for which you need to print the maximum amount of information on a page.

- **Enable.** Prints about 60 percent of the width of normal characters when compressed print is chosen by the host computer. For example, a 12 cpi font will compress to 20 cpi.
- **Disable.** Does not compress print widths, even if condensed print is chosen by the host.

### Alt. Set 80-9F

- **Control Code.** Interprets data in the range of hex 80 through hex 9F as a control code.
- **Printable.** Prints data in the range of hex 80 through hex 9F.
Page Format Submenu (H-Series)

Printer Protocol
Select the LinePrinter+ protocol you wish to use. Refer to the LinePrinter Plus Programmer's Reference Manual for more information with ASCII products.

For H-Series Hanzi GB, Hanzi Big5, or Kanji LP+ printers, refer to the the LQ-1600K Programmer's Reference Manual for details. For the H-Series Hangul LP+ printer, refer to the KS or KSSM Programmer's Reference Manual for details.

CPI/LPI Select
This parameter lets you specify the characters per inch (cpi) and lines per inch (lpi) values.

Host Command
This parameter allows you to block certain host commands from being acknowledged by the printer.

- **Enable** (factory default). All host commands are acknowledged by the printer.
- **Ignore All**. All host commands are ignored by the printer.
- **Ignore CPI**. All CPI commands sent by the host are ignored by the printer.
- **Ignore LPI**. All LPI commands sent by the host are ignored by the printer.
- **Ignore Unidir**. All Unidirectional commands sent by the host are ignored by the printer.
- **Ignore Pg. Fmt**. All page format commands sent by the host are ignored by the printer. This is applicable for H-Series Hangul LP+ printers only.
Font Attributes

Typeface (ASCII)

NOTE: Not all firmware types have the entire list of typefaces.

- **Data Processing** (factory default). A general purpose font printing out at 120 dpi horizontally and 72 dpi vertically. The width of the font will vary with each cpi.
- **NLQ**. A high quality font printing at 180 dpi horizontally and 96 dpi vertically. This font has serifs and the width of the font varies with the cpi.
- **OCR-A / OCR-B**. Optical character recognition fonts printing at 120 dpi horizontally and 144 dpi vertically. Both fonts print only at 10 cpi.
- **High Speed**. A draft quality font printing at 120 dpi horizontally and 48 dpi vertically. The width of the font varies with the cpi.
- **NLQ Sans Serif**. A high quality font printing at 180 dpi horizontally and 96 dpi vertically. This font prints without serifs. The width of the font varies with the cpi.
- **High Speed 100**. A draft quality font printing at 100 dpi horizontally and 48 dpi vertically. When chosen from the front panel, it defaults to 10 cpi. The cpi can then be varied, but the width will not change.
- **NLQ 200**. This NLQ font prints at 200 dpi horizontally and 96 vertically. When chosen from the front panel, it defaults to 12 cpi. The cpi can then be varied, but the width will not change.
- **DP 200**. This Data Processing font prints at 200 dpi horizontally and 72 vertically. When chosen from the front panel, it defaults to 12 cpi. The cpi can then be varied, but the width will not change.
- **High Speed 64**. This font prints at 120 dpi horizontally and 64 vertically. When chosen from the front panel, it defaults to 10 cpi. The cpi can then be varied, but the width will not change.
- **BARCODE 145**. This Data Processing font prints at 145 dpi horizontally and 72 vertically. When chosen from the front panel, it defaults to 12 cpi. The cpi can then be varied, but the width will not change.
- **BARCODE 160**. This Data Processing font prints at 160 dpi horizontally and 72 vertically. When chosen from the front panel, it defaults to 13 cpi. The cpi can then be varied, but the width will not change.

Typeface (H-Series)

This parameter allows you to select the typeface for printing in the emulation.

- **LQ**. Default value for Hanzi Big5/Hangul.
- **Near LQ**. Default value for Hanzi GB/Kanji printer.
- **Normal**
- **Hi-Speed**
- **Super Hi-Speed**
- **Ultra Hi-Speed**
**Styling Typeface (H-Series)**

- **SONG.** Only for Hanzi GB printer.
- **MING.** Only for Hanzi Big5 printer.
- **Mincho.** Only for Kanji printer.
- **Myungjo, Gothic.** Only for Hangul printer. Myungjo is the default value.

**Prop. Spacing (Proportional Spacing)**

Each printed character is contained inside a character cell. The width of the character cell includes the character and the space around the character. This menu only works in ASCII mode and is not available for the H-Series Hangul product.

- **Disable** (factory default). Each character cell is printed with the same width. Each column in the printed text will line up.

  *This example is printed with proportional spacing disabled.*

- **Enable.** The width of each character cell varies with the width of the character. For example, [i] takes less space to print than [m]. Using proportional fonts generally increases the readability of printed documents, which gives text a typeset appearance.

  *This example is printed with proportional spacing enabled.*

**Bold Print**

- **Disable** (factory default). Text is printed normally.
- **Enable.** Text is printed with a heavy line thickness.

**Italic Print**

- **Disable** (factory default). Text is printed normally.
- **Forward Slant.** Text is printed with a forward slant.
- **Backward Slant.** Text is printed with a backward slant.

**Slashed Zero**

This parameter allows you to print the numeral “0” with or without the slash. This option applies to all character sets except OCR-A and OCR-B.

- **Disable** (factory default). Zero is printed without a slash.
- **Enable.** Zero is printed with a slash.
DBCS/ASCII Mode (H-Series)

- **DBCS Mode** (factory default). The printer is in DBCS mode. It can print double-byte characters as well as a limited number of single-byte characters.
- **ASCII Mode**. The printer is in ASCII mode. It can only print single-byte characters.

DBCS ASCII Style (H-Series)

This parameter allows you to specify the appearance of the single-byte alphanumeric characters in DBCS mode.

- **Normal** (factory default).
- **Oversize**. The alphanumeric characters will appear larger than normal single-byte characters. For example, the appearance of character “8” will be changed to “8”.
- **OCR B**. The alphanumeric characters will print in OCRB style. It only takes effect on LQ typeface for Hanzi/Kanji printer.
- **Normal Thin**. The alphanumeric characters will be slightly thinner compared with Normal style. This is only applicable for Hangul printer.

Text Position

Specifies where the text will be positioned in the line space. When set to Top-of-Line, text will be positioned at the top of the line space. When set to Bottom-of-Line, the text will be positioned as if it were at the bottom of a 6 lpi line space. The following example shows both Top-of-Line and Bottom-of-Line text positions:

![Text Position Diagram](image)

Compressed Mode (H-Series)

This parameter allows you to specify the appearance of ASCII/DBCS characters in ASCII mode. It is not applicable for the H-Series Hangul printer.

- **Disable** (factory default)
- **Enable**. Prints out ASCII mode ASCII characters and half-width DBCS characters.
DBCS Compressed (H-Series)
This parameter allows you to specify the appearance of ASCII/DBCS characters in DBCS mode. It is not applicable for the H-Series Hangul printer.

- **Disable** (factory default)
- **Enable**, Both the DBCS and ASCII characters will be printed as half-width of their original size.

Font Scale (H-Series)
This parameter allows you to specify the appearance of the font size. It is applicable for the H-Series GB printer.

- **Standard** (factory default). The character prints as 24 x 24 cell size.
- **16 x 24**. The character prints as 16 x 24 cell size.

Encoding (H-Series)

- **Address Table** (factory default). Specifies the address table supported.
  - **GB18030** is for Hanzi GB printer.
  - **BIG5** (factory default), **CNS, TCA, ETEN, IBM5550, TELETEXT, BIG5+, BIG5E, and HKSCS** are for Hanzi Big5 printer.
  - **KSC5601** is for Hangul printer.
  - **Shift-JIS** is for Kanji printer.
- **UTF-8**. The printer takes in UTF-8 data stream and prints out according to Unicode format.

Taller 15 CPI (H-Series)
This parameter allows you to specify the appearance of ASCII characters as 15 CPI in ASCII mode.

- **Disable** (factory default). The characters in 15 CPI appear shorter than other CPIs such as 10 CPI.
- **Enable**, The height of 15 CPI characters is the same as other CPIs such as 10 CPI.

Horizontal Expnd (H-Series)
This parameter allows you to specify dot character horizontal expansion for both ASCII and DBCS characters in DBCS mode.

Vertical Expnd (H-Series)
This parameter allows you to specify dot character vertical expansion for both ASCII and DBCS characters in DBCS mode.
Graphics Spd Up (H-Series)

This menu is used to increase (speed up) graphic printing speed by turning on the Enhanced/Turbo mode.

- **Normal** (factory default). The printer prints at the given input graphics resolution.
- **Enhanced**. The printer provides first-level speed up, which means the speed is faster than Normal mode.
- **Turbo**. The printer provides second-level speed up, which means the speed is faster than Enhanced mode.
- **Match Typeface**. The input 180x180 dpi graphics resolution will drop-dot to the resolution which matches the typeface selected.

Page Format

Form Length

Forms length is the number of lines that can be printed on a page. You can set the form length in inches, millimeters (mm), or as a function of the current lpi (lines per inch).

**NOTE:** When IPDS is active, the form length only displays as a function of lines.

Form Width

The form width can be specified in inches, millimeters, or as a function of the current cpi (characters per inch). The forms width set should not exceed the actual paper width.

**NOTE:** When IPDS is active, the form width only displays as a function of characters.

Margins

- **Left Margin**. Set in columns. Column zero is defined as the far left edge of the page, and column numbering increments from left to right.
- **Right Margin**. Set in columns. Column zero is defined as the far right edge of the page, and column numbering increments from right to left.
- **Bottom Margin**. Defined in lines, starting from line zero at the bottom of the page and incrementing from the bottom up.

Perforation Skip

- **Disable** (factory default). Allows printing on page perforation.
- **1/2 inch, 2/3 inch, 5/6 inch, 1 inch**. You may set up a skip-over margin of 1/2 inch, 2/3 inch, 5/6 inch, or 1 inch. For example, a skip-over margin of 1 inch allows a 1 inch margin at the bottom of the page.
Print Char. Set
When this selection is displayed and the ENTER key is pressed, the current character set is printed.

Reset Cmd CFG Ld
When the printer receives a host data stream reset command (ESC @ or ESC[K) in addition to resetting printer variables, the selected configuration is loaded.

• Disable (factory default). The active emulation parameters are loaded when the reset command is executed.
• Power-Up Config. The power-up configuration is loaded when the reset command is executed.
• Current Config. The currently selected configuration is loaded when the reset command is executed.
• Factory Config. The factory installed configuration is loaded when the reset command is executed.

Set Substitution
When this option is activated, the character set overlay in RAM is activated. This can also be accomplished through a host command of SFCC RX. In either case, a flag is set indicating that the substitution table is active. If the power-up configuration has Ld Set at Pwrup and Set Substitution both enabled, the character set overlay is automatically activated at power-up or during a soft reset. See the LinePrinter Plus Programmer’s Reference Manual for more information.

Barcode x-offset
• Disable (factory default)
• Enable. Allows text to print next to a barcode when xxxx and yyyy are not set to the origin.

Barcode Height
• Disable (factory default)
• Enable. If Barcode x-offset is enabled, the barcode height follows P5000 legacy barcode behavior.

Error Handling (H-Series)
This command determines the way illegal DBCS characters are processed:
• Normal (factory default). Will ignore illegal DBCS characters.
• As Space. Will insert two space characters (0X20, 0X20) when the data stream contains the illegal DBCS character.
• As Square. Will insert a black square (0xA1BD) when the data stream contains the illegal DBCS character. This is applicable for the Hanzi Big5 build only.
P-Series Emulation

Control Code 06

Control Code 06 defines the function of ASCII code hex 06 (ACK). You can select an alternate line spacing of 6, 8, or 10.3 LPI.

Control Code 08

Control Code 08 defines the function of ASCII code hex 08 (BS). You can define the code to output the following character:

- **Elongated** (factory default).
- **Backspace**.

Define CR Code

This option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a carriage return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends Line feeds to the printer.

- **CR = CR** (factory default). Does not insert an extra line feed after each carriage return.
- **CR = CR + LF**. Inserts an extra line feed after each carriage return. The next print position will be print position 1 of the next line.
Auto LF

This option defines the printer action when print data is received past the forms width setting.

- **Disable** (factory default). Discards any data past the forms width.
- **Enable**. Performs an automatic carriage return and line feed when data is received past the forms width, causing the excess text to print on the next line.

Overstrike

This option enables you to print bold characters.

- **Enable** (disable). Turns on bold print. When enabled, overstrike printing slows down the printer.
- **Disable**. Turns off bold print.

Define LF Code

- **LF = CR + LF** (factory default). Forces an automatic carriage return with each line feed command. The next print position is print position 1 of the next line.
- **LF = LF**. Does not perform an automatic carriage return. The next print position will be the current print position of the next line.

P-Series SFCC

This parameter allows you to select which ASCII codes will function as the Special Function Control Code (SFCC) command delimiter.

P-Series codes can use hex 00 through hex 7F. Options include the following:

- **ESC** (hex 1B)
- **SOH** (hex 01)
- **ETX** (hex 03)
- **CIRCUMFLEX** (hex 5E)—also called caret (^)
- **TILDE** (hex 7E)—(~)

**NOTE:** SOH, ETX, and ESC are non-printables. The characters (^) and (~) are printable; however, do not use them as printables in the host data stream if either is chosen as a delimiter because print errors will occur.
VFU Select
Controls how the printer handles vertical formatting.

- **EVFU** (factory default). Enables the VFU and selects P-Series compatible Electronic Vertical Format Unit (EVFU).
- **DVFU**. Enables the VFU and selects the Dataproducts compatible Direct Access Vertical Format Unit (DVFU).
- **CVFU**. Enables the VFU and selects the Centronics compatible Direct Access Vertical Format Unit (CVFU).
- **Disable**. Disables all VFU processing.

Alt. Set 80-9F
Determines whether the printer processes ASCII codes hex 80 through hex 9F as control codes or as printable characters. The options include:

- **Control Code** (factory default)
- **Printable**.

Character Set
Specifies a character set as shown in the “P-Series Character Set Menu” on page 139. To use one of these sets, choose the desired group heading (such as European Sets) and press ENTER. Then choose the desired set within that group (such as Roman 8) and press ENTER. Both the group and the desired set will be starred to indicate your selection. The UTF-8 selection allows printing of UTF-8 encoded Unicode™. Character sets are shown in detail in the Character Sets Reference Manual.

SFCC d Command

- **Even dot plot** (factory default). This option interprets SFCC d Command as even dot plot.
- **Double High**. This option interprets SFCC d Command as double high. Select this option for backward compatibility.

PSeries Dbl High
Allows printing compatibility between current and older model printers.

- **Normal** (factory default). This is normal, double-high printing for current model printers.
- **P3/4/6/9 Comp**. Where older printers print two dot rows higher, this option allows for compatibility by raising the print two dot rows to match the current models dot row value (two dot rows lower).

FF Valid at TOF

- **Enable** (factory default). Performs a form feed when the host sends a Form Feed command and the printer is at the top of form.
- **Disable**. Will not perform a form feed when the host sends a Form Feed command and the printer is at the top of form.

Control Code 06

Control Code 06 defines the function of ASCII code hex 06 (ACK). You can select an alternate line spacing of 6, 8, or 10.3 LPI.

Define CR Code

This option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends line feeds to the printer.

- **CR = CR** (factory default). Does not insert an extra line feed after each carriage return.
- **CR = CR + LF**. Inserts an extra line feed after each carriage return. The next print position will be print position 1 of the next line.

Auto LF

This option defines the printer action when print data is received past the forms width setting.

- **Disable** (factory default). Discards any data past the forms width.
- **Enable**. Performs an automatic carriage return and line feed when data is received past the forms width.
Define LF Code

- LF = CR + LF (factory default). Forces an automatic carriage return with each line feed command received. The next print position is print position 1 of the next line.
- LF = LF. Does not perform an automatic carriage return when a line feed command is received. The next print position will be the current print position of the next line.

Compressed Print
Controls which host command sets compressed printing.

- Char 01 SOH (factory default)
- Char 03 ETX
- Char 09 HT

Elong/Alt. Font
Controls which host command sets elongated (double high) fonts and extended character set.

- Elng=BS Font=SO (factory default)
- Elng=SO Font=BS

HS Print (High Speed Print)
Controls which host command sets high speed printing.

- Char 02 STX (factory default)
- Char 03 ETX
- Char 09 HT

VFU Select
Controls how the printer handles vertical formatting. The choices are:

- EVFU (factory default). Enables the VFU and selects P-Series compatible Electronic Vertical Format Unit (EVFU).
- DVFU. Enables the VFU and selects the Dataprocess compatible Direct Access Vertical Format Unit (DVFU).
- CVFU. Enables the VFU and selects the Centronics compatible Direct Access Vertical Format Unit (CVFU).
- Disable. Disables all VFU processing.
Upr. Case Select
Controls how the printer handles lowercase characters it receives from the host computer. When enabled, all characters will be printed in uppercase.

- **Disable** (factory default). Prints lowercase characters received from the host computer as lowercase, and prints uppercase characters received from the computer as uppercase.
- **Enable**. Prints lowercase characters received from the host computer as their corresponding uppercase equivalents; uppercase characters received from the computer print as uppercase.

Slew Relative
“Slewing” is rapid vertical paper movement. This parameter determines the number of lines slewed (either 1-15 lines or 1-16 lines) when an EVFU Slew Relative command is received. The options include:

- **1-15 Lines**
- **1-16 Lines** (factory default)

Serial Matrix Emulation

* = Factory Default
Control Code 06

Control Code 06 defines the function of ASCII code hex 06 (ACK). You can select an alternate line spacing of 6, 8, or 10.3 LPI.

Define CR Code

This option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends line feeds to the printer.

- **CR = CR** (factory default). Does not insert an extra line feed after each carriage return.
- **CR = CR + LF**. Inserts an extra line feed after each carriage return. The next print position will be print position 1 of the next line.

Auto LF

The Auto LF option defines the printer action when print data is received past the forms width setting.

- **Enable** (factory default). Performs an automatic carriage return and line feed when data is received past the forms width.
- **Disable**. Discards any data past the forms width.

Overstrike

This option enables you to print bold characters.

- **Enable** (factory default). Turns on bold print. When enabled, overstrike printing slows down the printer.
- **Disable**. Turns off bold print.

Define LF Code

- **LF = LF** (factory default). Does not perform an automatic carriage return when a line feed command is received. The next print position will be the current print position of the next line.
- **LF = CR + LF**. Forces an automatic carriage return with each line feed command received. The next print position is print position 1 of the next line.
Printer Select

- **Disable** (factory default). Ignores the ASCII DC1 and DC3 control codes.
- **Enable**. Disables the printer when a DC1 control code is received, and enables the printer when a DC3 control code is received.

Alt. Set 80-9F

- **Control Code** (factory default). Interprets data in the range of hex 80 through hex 9F as a control code.
- **Printable**. Prints data in the range of hex 80 through hex 9F.

Character Set

Specifies a character set as shown in the “Serial Matrix Character Set Menu” on page 146. To use one of these sets, choose the desired group heading (such as European Sets) and press ENTER. Then choose the desired set within that group (such as Roman 8) and press ENTER. Both the group and the desired set will be starred to indicate your selection. Character sets are shown in detail in the *Character Sets Reference Manual*.

ESC d command

- **Even dot plot** (factory default). Interprets the ESC d command as even dot plot.
- **Double high**. Interprets the ESC d Command as double high. Select this option for backward compatibility.

## Proprinter XL Emulation

### Define CR Code

This option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends line feeds to the printer.

- **CR = CR** *(factory default)*. Does not insert an extra line feed after each carriage return.
- **CR = CR + LF**. Inserts an extra line feed after each carriage return.

### Auto LF

This option defines the printer action when print data is received past the forms width setting.

- **Enable** *(factory default)*. Performs an automatic carriage return and line feed when data is received past the forms width.
- **Disable**. Discards any data past the forms width.

### Define LF Code

- **LF = LF** *(factory default)*. Does not perform an automatic carriage return when a Line Feed command is received. The next print position will be the current print position of the next line.
- **LF = CR + LF**. Forces an automatic carriage return with each Line Feed command received. The next print position is print position 1 of the next line.

### FF Valid at TOF

- **Enable** *(factory default)*. Performs a form feed when the host sends a Form Feed command and the printer is at the top of form.
- **Disable**. Will not perform a form feed when the host sends a Form Feed command and the printer is at the top of form.
Character Set

Specifies a character set as shown in the “Proprinter XL Character Sets Menu” on page 150. To use one of these sets, choose the desired group heading (such as European Sets) and press ENTER. Then choose the desired set within that group (such as Roman 8) and press ENTER. Both the group and the desired set will be starred to indicate your selection. The UTF-8 selection allows printing of UTF-8 encoded Unicode™. Character sets are shown in detail in the Character Sets Reference Manual.

Alt. Char Set

This option determines if data in the range of hex 80 through hex 9F should be interpreted as a control code or as a printable character.

- **Set 1** (factory default). Interprets data in the range of hex 80 through hex 9F as a control code.

- **Set 2**. Prints data for the characters at hex locations 03, 04, 05, 06, 15, and 80 through 9F.

20 CPI Condensed

Compressed print characters are narrower than the normal character set. This is helpful for applications where you need to print the maximum amount of information on a page.

- **Enable** (factory default). Prints characters about 60 percent the width of normal characters when compressed print is chosen by the host computer.

- **Disable**. Does not compress print widths, even if condensed print is chosen by the host.

* = Factory Default
Define CR Code

The Define CR Code option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a carriage return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends line feeds to the printer.

- **CR = CR** (factory default). Does not insert an extra line feed after each carriage return.
- **CR = CR + LF**. Inserts an extra line feed after each carriage return.

Auto LF

This option defines the printer actions when print data is received past the forms width setting.

- **Enable** (factory default). Performs an automatic carriage return and line feed when data is received past the forms width.
- **Disable**. Discards any data past the forms width.

Define LF Code

The Define LF Code option controls the action of the printer when it receives a Line Feed code (hex 0A) from the host computer. If this feature is enabled, each time the printer receives a Line Feed, it inserts an additional Carriage Return code (hex 0D) into the data stream. This feature is required if the host computer does not send carriage returns to the printer.

- **LF = LF** (factory default). Does not add a carriage return with a line feed.
- **LF = CR + LF**. Adds an extra carriage return with each line feed.
Printer Select

- **Disable** (factory default). Ignores the ASCII DC1 and DC3 control codes.
- **Enable**. Disables the printer when a DC1 control code is received, and enables the printer when a DC3 control code is received.

Character Set

This parameter selects a character set for the Epson emulation, as shown in the “Epson FX Character Set Menu” on page 153.

**NOTE:** When OCR-A or OCR-B is selected as the print language, the Font Attribute Typeface option under the LinePrinter Plus menu (page 116) is changed to OCR-A or OCR-B, respectively.

To use one of these sets, choose the desired group heading (such as European Sets) and press ENTER. Then choose the desired set within that group (such as Roman 8) and press ENTER. Both the group and the desired set will be starred to indicate your selection. The UTF-8 selection allows printing of UTF-8 encoded Unicode™. Character sets are shown in detail in the Character Sets Reference Manual.

20 CPI Condensed

Compressed print characters are narrower than the normal character set. This is helpful for applications where you need to print the maximum amount of information on a page.

- **Enable** (factory default). Prints about 60 percent of the width of normal characters when compressed print is chosen by the host computer. For example, a 12 CPI Draft font will compress to 20 CPI.
- **Disable**. Does not compress print widths, even if condensed print is chosen by the host.

Alt. Set 80-9F

- **Control Code** (factory default). Interprets data in the range of hex 80 through hex 9F as a control code.
- **Printable**. Prints data in the range of hex 80 through hex 9F.

CPI/LPI Select
Defines the default values for the horizontal and vertical character spacing. The number of characters per inch can range from 10.0 through 17.1. The number of lines per inch can range from 3.0 through 8.0.

Font Attributes

Typeface
Choose a typeface from the available options.

Prop. Spacing (Proportional Spacing)
Each printed character is contained inside a character cell. The width of the character cell includes the character and the space around the character.

- **Disable** (factory default). Each character cell is printed with the same width. Each column in the printed text will line up.

  This example is printed with proportional spacing disabled.

- **Enable**. The width of each character cell varies with the width of the character. For example, [i] takes less space to print than [m]. Using proportional fonts generally increases the readability of printed documents, giving text a typeset appearance.

  This example is printed with proportional spacing enabled.

Bold Print

- **Disable** (factory default). Text is printed normally.
- **Enable**. Text is printed with a heavy line thickness.

Slashed Zero
This parameter allows you to print the numeral “0” with or without the slash. This option applies to all character sets except OCR-A and OCR-B.

- **Disable** (factory default). Zero is printed without a slash.
- **Enable**. Zero is printed with a slash.
Page Format

Margins

- **Left Margin.** Defines where the first print column is located. The left margin is specified as the number of characters from the left edge of the form.

- **Right Margin.** Defines where the last print column is located. The right margin is specified as the number of characters from the right edge of the form.

- **Top Margin.** Defines the location of the first print line on the page. The top margin is specified as the number of lines from the top of the form's position.

- **Bottom Margin.** Defines the location of the last print line on the page. The bottom margin is specified as the number of lines from the bottom of the form's position.

Form Length

Specifies the form length in lines. The maximum form length in lines depends on the current LPI setting; it is equal to the maximum form length in inches multiplied by the current LPI setting. For example, at 6 LPI the maximum form length is 6 LPI x 24 inches = 144 lines.

Only valid form length values will be accepted. If you select a length that is larger than the maximum length for the current LPI, the maximum length will be used. If you need a longer page length, you must first change the LPI.

**IMPORTANT**  If the form length is set in lines and you change the LPI, the effective page length changes to the form length in characters divided by the new LPI.

**NOTE:** Receipt of a data stream control code which changes the form length overrides the form length previously specified via the operator panel.

Form Width

Allows you to input the form width in characters from 1 through 272. The maximum form width in characters depends on the current CPI setting; it is equal to the maximum form width in inches multiplied by the current CPI setting.

Only valid form width values will be accepted. If a width is selected that is larger than the maximum width for the current CPI, then the maximum width will be used. If a larger width value is desired, then the CPI value must be changed first.
Table 9 lists the maximum number of characters that can be printed for a given Characters Per Inch (CPI) setting.

**IMPORTANT** If the form width is set in characters and the CPI is changed, the effective page width is changed to be equal to the form width in characters divided by the new CPI.

**Define CR Code**

The Define CR Code option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a carriage return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends line feeds to the printer.

- **CR = CR** (factory default). No extra line feeds are inserted.
- **CR = CR + LF**. Inserts an extra line feed after each carriage return.

**Auto LF**

Defines the printer actions when print data is received past the form width setting.

- **Disable** (factory default). Discards any data past the form width.
- **Enable**. Performs an automatic carriage return and line feed when data is received past the form width.

**Define LF Code**

Controls the action of the printer when it receives a Line Feed code (hex 0A) from the host computer. If this feature is enabled, each time the printer receives a line feed, it inserts an additional carriage return code (hex 0D) into the data stream. This feature can be used in most installations, but it is required if the host computer does not send carriage returns to the printer.

- **LF = CR + LF** (factory default). Adds an extra carriage return with each line feed.
- **LF = LF**. Does not add a carriage return with a line feed.
Character Set
This parameter selects a character set for the ANSI emulation. Note that when 0876 OCR-A or 0877 OCR-B is selected as the print language, the Font Attributes Typeface parameter is changed to OCR-A or OCR-B, respectively. Character sets are shown in detail in the Character Sets Reference Manual.

Printer Select
- ON = DC1/OFF = DC3 (factory default). Disables the printer when a DC1 control code is received, and enables the printer when a DC3 control code is received.
- Disable. Ignores the DC1 and DC3 control codes.

ESC c Sequence
- Enable (factory default). An ESC c code received from the host resets the printer parameters to the factory defaults.
- Disable. An ESC c code received from the host is ignored.

Reset Cmd CFG Ld
When the printer receives a host data stream reset command (ESC @ or ESC[K) in addition to resetting printer variables, the selected configuration will be loaded.
- Disable (factory default). The active emulation parameters are loaded when the reset command is executed.
- Power-Up Config. The power-up configuration is loaded when the reset command is executed.
- Current Config. The currently selected configuration is loaded when the reset command is executed.
- Factory Config. The factory installed configuration is loaded when the reset command is executed.

Received CR
- Observe (factory default). A CR code received from the host is handled as a carriage return.
- Ignore. A CR code received from the host is ignored.

Received DEL
- Observe (factory default). A DEL code received from the host is handled as a Delete command.
- Ignore. A DEL code received from the host is ignored.

Private Mode
Determines the default type of character set (Set 1 or Set 2). This can also be set by ESC sequences ESC [>5h and ESC [>5l. Refer to these descriptions in the ANSI Programmer’s Reference Manual for further details.
Pos. on BC/OvrSz

- **Set to top** (factory default). The paper is fed back to the top of barcodes or oversized characters after they are printed. This allows printing on the same line.
- **Set to bottom**. The printer will continue printing without backing up.

BC Check Digit

- **By host** (factory default). The host calculates the barcode check digit and sends it along with the barcode. The check digit is not verified by the printer but printed as it was received.
- **By printer**. The barcode is sent without the check digit, and the printer calculates and adds it in.

Barcode Darkmode

- **Enable** (factory default). The barcodes are printed at a higher resolution.
- **Disable**. The barcodes are printed at lower resolution but at a higher speed.

PUM Default

This is the Unit of Measure (UOM) as it is used within the ANSI emulation. Coordinates received in ESC sequences can be sent in two UOMs:

- **Decipoints** (factory default). A unit of 1/720 inch
- **Lines or columns**. Uses the current LPI and CPI values.

The UOM used is determined by this configuration setting.

Truncate PI Slew

- **Truncate at TOF** (factory default). The slew is terminated when the next Top-of-Form is reached. (This function applies to the ANSI EVFU only.)
- **Disable**. PI slews will be completed independent of their length.

ETX/ACK

End of Text/Acknowledge. The host controls the flow of communication to the printer by sending a block of data and ending the block with an End of Text (ETX) signal. When the printer receives the ETX signal, it acknowledges the ETX, thereby acknowledging it has received the entire block of data.

- **Disable** (factory default)
- **Immediate**
- **Afterprint**
IGP/PGL Emulation

The PGL emulation is the software based Intelligent Graphics Processor (IGP) for the line matrix family of printers. It is based upon, and is compatible with, the IGP-100/200/400 board using the PGL. The IGP graphics processing features are detailed below.

Features

On-Line Form and Label Generation makes it easy to create forms or labels with a “preprinted” look for each application. IGP programs control all graphic functions, dramatically reducing host computer programming and processing time.

Graphic capabilities include boxes, vertical and horizontal lines with user-selectable thickness, logos, and special alphanumeric print features. Forms and graphic designs can be duplicated horizontally and vertically.

Alphanumeric data can appear as prepositioned “fixed” information (entered when the form is created), be overlayed onto the form (positioned in a specific location after the form is created), or can be dynamically merged with the form.

Selectable Barcodes provide you with the appropriate barcode for your application using standard wide-to-narrow ratios. A wide selection of barcodes is available: Code 39, Interleaved 2 of 5, 4-state USPS Intelligent Mail, UPC-A, UPC-E, MSI A through D, Code 128 Subset A, B, and C, EAN/UCC-128, EAN 8, EAN 13, POSTNET, PostBar, Royal Mail, Datamatrix, and PDF417. UPC and EAN barcodes can specify add-on data.

Expanded and Compressed Character Print attract attention where needed. Alphanumeric height and width are controlled independently for a wide range of character sizes up to 113 times the standard character size (up to 11.3 inches wide and tall). Compressed print sizes of 10, 12, 13, 15, 17, and 20 characters per inch (cpi) are available.

Logos are created using alphanumeric commands and add many print and shading features for a “customized” appearance to forms, reports, and labels.

Rotated Alphanumericics permit new concepts in form design. Normal, expanded, and compressed character strings can be rotated 90 degrees clockwise or counterclockwise, or they can be printed upside down.

Reversed Print permits highlighting and contrasting by printing white characters on a dark background.

Automatic Increment/Decrement Capability allows batch form processing. Individual alphabetic, numeric, and barcode data fields can be identified and automatically incremented or decremented by any amount, beginning from a specified reference point.

Scaling Capability permits graphic elements, such as corners or boxes, to retain their physical shapes and sizes when printed in a horizontal and vertical density other than the base density of 60 x 72 dpi.
Multinational Character Sets provide many international character sets, each 96 characters in length. This feature also allows you to create your own character sets using characters defined and stored in memory.

Extended Character Sets provide 33 extended character sets, also containing 96 characters in length. These are also stored in memory.

Configuring the Emulation with the Control Panel

You can select PGL default parameters directly from the control panel or by control codes as explained in the IGP/PGL Programmer’s Reference Manual. The PGL parameters are described on the following pages. Parameters marked with an asterisk (*) indicate the default value. The printer must be offline to enter the configuration structure.

Pressing an invalid key to enter a parameter value may move you to another level in the configuration or exit the configuration menu completely. Configure the IGP/PGL according to your specific requirements.

IMPORTANT BEFORE you reconfigure the IGP/PGL, print a configuration sheet to see all of the current settings.

* = Factory Default
Define CR (Carriage Return) Code
This parameter forces the printer to insert an automatic Line Feed code into the data stream whenever a Carriage Return code occurs. This is to be used only if the host computer does not send line feeds to the printer.
- CR = CR (factory default). Does not perform a line feed. The next print position will be print position 1 of the current line.
- CR = CR + LF. Performs an automatic line feed. The next print position will be print position 1 of the next line.

Define LF (Line Feed) Code
This parameter forces the printer to insert an automatic Carriage Return code into the data stream whenever a Line Feed code occurs. This can be used in most installations, but it is required if the host computer does not send carriage returns to the printer.
- LF = LF (factory default). Does not perform an automatic carriage return. The next print position will be the current print position of the next line.
- LF = CR + LF. Performs an automatic carriage return. The next print position will be print position 1 of the next line.

Autowrap
This parameter determines if text will wrap to the next line when the line of text exceeds the right margin.
- Disable (factory default). Truncates the text beyond the right margin until a CR or CR + LF is received.
- Enable. Automatically inserts a CR + LF after a full print line.

PGL SFCC
You can specify which hex code (1-255) will be used as the Special Function Control Code (SFCC). The factory default setting is 126. The SFCC denotes that the following data is a PGL command.

PI Slew Range
You can specify how many lines the paper will feed.
- 16 (factory default). A paper slew of 0-15 will move 1-16 lines.
- 15. A paper slew of 1-15 will move 1-15 lines. A paper slew of 0 will move 1 line.

CR Edit
This parameter determines if a carriage return will be followed by a line feed.
- Disable (factory default). The printer ignores all carriage returns that are not followed by line feeds.
- Enable. The printer processes all carriage returns, even for those that are not followed by line feeds.
Select Font
Select Font specifies which language is currently selected for use with the PGL. Refer to “IGP/PGL Font Set Menu” on page 172. for available selections.

Slash 0
This parameter allows you to print the numeral “0” with or without the slash. This option applies to all character sets except OCR A and OCR B.
- **Disable** (factory default). Zero is printed without a slash.
- **Enable.** Zero is printed with a slash.

Select LPI
This is the number of lines to be printed per inch. For example, at 6 lpi there is 1/6 inch from the top of one print line to the top of the next print line. The options are:
- **6.0** (factory default)
- **8.0**
- **9.0**
- **10.0**

Auto Uppercase
This parameter enables the printer to print text in all uppercase when using the ALPHA command.
- **Disable** (factory default). The printer will print text in upper and lowercase.
- **Enable.** The printer will print text in uppercase only.

Skip Cmd Prefix
This parameter determines if the printer will print any data before a PGL command is received.
- **Enable** (factory default). The printer ignores all data on the current line before an IGP command.
- **Disable.** The printer will print all data on the current line before an IGP command.

Forms Handling
This submenu allows the user to handle the form in the following ways:
- **Disable** (factory default). No effect.
- **Auto Eject.** Automatically ejects a page at the end of the job to spill out the last page.
- **Auto TOF.** Automatically does a form feed (FF) at the end of each form to the next top of form.
Power On IGP/PGL

You can set the IGP feature so that it is enabled or disabled when the printer is powered on.

- **Enable** (factory default). The PGL is enabled when the printer is powered on. (The PGL feature is initialized in the Normal mode.)
- **Disable**. The PGL is disabled when the printer is powered on. (The PGL feature is initialized to the Quiet mode.)

Ext Execute Copy

- **Disable** (factory default). Dynamic data and overlay data are not allowed if the optional Form Count parameter (number of forms to print) is specified as part of the Execute command. (This setting is IGP-100 compatible.)
- **Enable**. Only dynamic data is allowed within a form in which the Form Count parameter is specified in the Execute command. In this case, the exact same form (with identical dynamic data, etc.) is printed for the Form Count. However, incremental data is not incremented since the page that is printing is exactly the same. Also, each form is printed on a separate page.

Barcode Options

The following sub-options help define specific options regarding barcode printing.

UPC Descenders

This parameter allows you to print barcode descenders when human readable data is not present in the UPC/EAN barcodes.

- **Always** (factory default). UPC/EAN barcodes are printed with descenders, even if there is no human readable data.
- **Never**. UPC/EAN barcodes are printed without descenders if there is no human readable data.
- **Only with PDF**. UPC/EAN barcodes are printed with descenders only when the PDF command is present.
Optimized Ratio

This option selects different barcode ratios for certain barcodes including Code 39 and I-2/5. It is included for compatibility with the IGP-X00 printers.

- **Disable** (factory default). Use standard barcode ratios.
- **Enable**. Select the alternate barcode ratios.

I-2/5 Selection

This option is added to be compatible with a special IGP-X00 customization. Usually, if I-2/5 barcodes have an odd number of digits, a leading zero is inserted in front of the data. However, this special IGP-X00 customization gives you the option of adding a space character at the end of the barcode instead.

- **Leading Zero** (factory default). A leading zero is inserted in front of the printable data field.
- **Trailing Space**. A space is inserted at the end of the printable data field and a zero is encoded with the corresponding space in the end of the barcode.
- **Modulo 7 CD**. The I-2/5 barcode uses a modulo 7 check digit instead of the default modulo 10 check digit.

AI 00 Spaces

This option is designated for EAN/UCC-128 barcodes whose application identifier (AI) is 00.

- **Disable** (factory default). The printable data field is printed with the AI enclosed in parentheses. This is the standard EAN/UCC-128 format.
- **Enable**. The printable data field is printed with the UCC fields separated by spaces. This option is IGP-X00 compatible.

Select SO Char

Allows you to specify a decimal code from 0 through 255 to be used in place of SO (Shift Out) as the control code. This allows access for the alternate set of control function characters. See the description of the Code 128 barcodes in the *IGP/PGL Programmer's Reference Manual* for details.

User-Def Ratio

- **Enable** (factory default). User-defined ratios are accepted for barcodes.
- **Disable**. User-defined ratios are ignored and the magnification X1 is used in its place.
C39 Compatbl.

This menu makes the old method of decoding C39 alternative character set compatible with the new.

- **Disable** (factory default) Uses the current way of decoding.
- **Enable**. Matches the old method of decoding.

**Host Form Length**

Determines whether the form length specified in the CREATE command changes the form length designated in the LP+ menu (see “LinePrinter Plus Emulation (ASCII)” on page 116) when the form is printed by the EXECUTE command.

- **Disable** (factory default). The LP+ form length is unaffected by the form being printed.
- **Enable**. The LP+ form length changes to match the length of the PGL form being printed.

**Var Form Adjust**

(Ranges from 0 - 30). Default is 0. This menu value is tenths of inches. The value of this menu specifies the amount of distance to add to PGL forms that have variable form lengths. Variable length forms are forms that are defined by using a “;0” in the CREATE statement: ~CREATE;FORM;0. Variable form lengths are defined by the contents within the form - the form is only as long as necessary to print the form. Changing this menu value adds additional lengths to the form (in tenths of inches). Again, this only applies to forms that use the “;0” variable length forms.

**Var Form Type**

This menu option applies only to the host command, CREATE;NAME or CREATE;NAME;DISK. The host command CREATE;NAME followed by ;0, ;X or a form length number will always override the menu option.

- **Add Nothing** (factory default). No action.
- **Add; 0**. When selected, the form length ends at the longest printed element. Same as CREATE;NAME;0.
- **Add; X**. When selected, the form length is the same as the physical page length.

**Compressed CPI**

This parameter allows you to choose a compressed character (60% shorter) for 17 or 20 cpi instead of the normal height character.

- **Disable** (factory default). The PGL does not use compressed 17 or 20 cpi font.
- **Light Font**. Uses the standard compressed 17 or 20 cpi font.
- **Dark Font**. Uses a darker compressed 17 or 20 cpi font compatible with the IGP-X00 printers.
Ignore Char

- **Ignore Mode**
  This parameter instructs the PGL to ignore the character selected under the Select Character menu.
  - **Disable** (factory default). The PGL does not ignore any characters.
  - **Enable**. The PGL ignores the characters specified in the Select Character menu.

- **Select Char**
  Instructs the PGL which decimal character (0-255) to ignore from the host.

Compatbl. Mode

This option instructs the PGL to behave similarly to older versions of the IGP with respect to certain commands.

All new users with new applications should select the “None” option. Selecting this mode insures the printer will behave as described in this manual.

When replacing an older product operating with an existing application, especially those using the PMODE and SMODE commands, you may need to select a compatibility mode. In this case, select the printer model number option that most closely matches the printer being replaced. The Compatibility Mode options include:

- **None** (factory default)
- **MVP**
- **L150**
- **P3000**
- **P6000**
- **P9000**

Expanded Font

This option defines the type of expanded characters the PGL will select:

- **Scalable** (factory default). These expanded characters have rounded edges.
- **Block**. These are block characters compatible with the IGP-X00 printers.
- **Alt Block 1 / Alt Block 2**. Reserved block sets used only for compatibility purposes.

Scalable Size

- **Normal** (factory default). Controls the size of scalable characters to be either normal size (as set by the user) or adjusted to match the size of block fonts.
- **Block**. Adjusts the size of scalable characters to exactly match its block font alternative.
True Form Slew

This option is related to slewing within forms when using the PMODE command. Customers with new applications are advised to keep this option enabled.

- **Enable** (factory default). Form length is accurate according to the form length parameter in the CREATE command.
- **Disable**. Form length is IGP-X00 compatible when using PMODE.

Printer PI Line

This option enables the IGP to send PI instructions to the printer to slew the form.

- **Enable** (factory default). Send the PI instructions to the printer (LinePrinter Plus) during form slew. This is IGP-X00 compatible.
- **Disable**. Do not send PI instructions to the printer. LFs are sent instead.

Print Quality

- **Data Processing** (factory default). The emulation prints at 60 x 72 dpi and lets you choose between normal alphanumerics and barcodes and dark mode alphanumerics and barcodes. This mode should be set if you want the highest speed.
- **High**. The emulation prints at 120 x 72 dpi, but all alphanumerics and barcodes are automatically printed in dark mode.
- **Best**. The emulation prints at 120 x 144 dpi and dark mode, which produces a higher resolution, better-looking print image.

Power-on S-Mode

This option instructs the PGL to behave similarly to older versions of the IGP with respect to certain commands.

All new users with new applications should select “0,” the default option. Selecting this mode insures the printer will behave as described in this manual.

Power on S-Mode sets the printer in an SMODE compatibility state at power-up. The default is 0 (disabled, no power-on mode). To use this feature, select a mode from 1 through 5, which puts IGP/PGL in an SMODE state according to the compatibility mode set. If the compatibility mode set is None, then MVP is assumed by default.

For more information, see the *IGP/PGL Programmer's Reference Manual*. 
Trunc Dyn Data
This submenu allows the user to truncate the dynamic data up to the maximum data length specified in Create Mode.

- **Disable** (factory default). If the dynamic data exceeds the maximum data length, an error will report.
- **Enable**. If the dynamic data exceeds the maximum data length, the data truncates.

Error Report
Sets the error reporting capability for IGP/PGL forms.

- **On** (factory default). Form boundary error checking reported. Any element which falls off the current page is reported as an error.
- **Debug Mode**. The printer is put in debug mode whenever a form is defined in Create Form mode. Each line of the Create Form is printed along with an error if one occurred. This is the same functionality as if there were a slash (/) entered before the Create Form Name.
- **Fault**. When an error occurs, the error is printed and the message “IGP/PGL ERROR” appears on the printer front panel. The printer then stops printing and goes offline. The error must be cleared before the printer can resume normal operation.
- **Host**. When an error occurs, the error message is sent back to the host.
- **Off**. No form boundary checking. Graphic elements appear clipped if they are beyond the page boundaries.

Select Font
Allows you to choose from various character sets, including IGP/PGL Standard sets, 256 character multinational sets, and UTF-8 encoded Unicode™.
**IGP/PGL Font Set Menu**

IGP/VGL Emulation

Code V Graphics language (VGL) is an Intelligent Graphics Printing (IGP) software emulation designed for your Line Matrix printer. The IGP Code V emulation of the QMS® Code V Version II programming language produces online forms, barcodes, and alphanumeric text-generation. The graphics processing features are detailed below.

Features

OnLine Form and Label Generation makes it easy to create forms or labels with the “preprinted” look for each application. VGL programs control all graphics functions, dramatically reducing host computer programming and processing time. Graphics capabilities include boxes, vertical and horizontal, solid and dashed lines with a variety of thickness, logos, and special alphanumeric print features.

Variable Barcodes allow the barcode for your application to print with standard or user-defined ratios in vertical or horizontal orientations. Available barcodes are Codabar, Code 39, Code 93, Code 128 with Subsets A, B, and C, and Code EAN/UCC 128, EAN 8, EAN 13, Interleaved 2 of 5, 4-state USPS Intelligent Mail, MSI, UPC-A, UPC-E, POSTNET, PostBar, Royal Mail, and UPC Shipping. POSTNET is available only in the horizontal direction. A dark print mode is included for darker, high-contrast barcodes. The IBARC barcode command prints barcodes in four orientations: horizontal, rotated 90, rotated 180, or rotated 270 degrees.

Expanded and Compressed Print draws attention where needed. Alphanumeric height and width are controlled independently for a tremendous range of character sizes up to 9.9 inches wide and tall. Several compressed print sizes are available: 12, 13.33, 15, 17.65, and 20 (cpi), permitting up to 170 columns in an 8.5 inch printed area (20 cpi).

Rotated Alphanumerics permit new concepts in form design. Normal, expanded, and compressed character strings can be rotated 90 degrees clockwise, counterclockwise, or printed upside down.

Logos are easily created using alphanumeric commands and a variety of print and shading features, which provides a “customized” appearance for forms, reports, and labels. The registered trademark, copyright, TUV®, GS-Mark, UL®, and CSA® symbols are provided as standard designs on the VGL, and you can also define custom symbols.

Reverse and Shaded Print permit highlighting and contrasting by printing white characters on a dark background or white characters on a gray, shaded background. Various levels or patterns of gray shading and reverse printing may combine with the many other print features to create distinctive designs.

Automatic Increment/Decrement Capability allows batch form processing. Individual alphabetic, numeric, and barcode data fields can be identified and automatically incremented or decremented by any amount, beginning from a specified reference point.

Standard Character Sets provide you with many different character sets. Based on the Multinational Character Set, you can create your own character sets using characters defined and stored in flash memory.
Configuring the Emulation with the Control Panel

You can select VGL default parameters directly from the control panel or by control codes as explained in the *IGP/VGL Programmer’s Reference Manual*. The VGL parameters are described on the following pages. Parameters marked with an asterisk (*) indicate the default value. The printer must be offline to enter the configuration structure.

**IMPORTANT** BEFORE you reconfigure the IGP/VGL, print a configuration sheet to see all of the current settings.

Pressing an invalid key to enter a parameter value may move you to another level in the configuration menu or exit the menu completely.

IGP/VGL Submenu

IGP/VGL Graphics Options Submenu

* = Factory Default

SFCC & Pwrup

This option has several sub-options which define the SFCC and power-up configuration used with VGL.

VGL SFCC

This option selects the Special Function Control Code. The default value 5E. Run a configuration printout to determine the currently selected VGL SFCC.
Power Up ^X

- **Disable** (factory default).
- **Enable**. Selects the ignore mode as the power-up default and selects the graphics mode ^PY as the power-up default. All characters are ignored until a ^A command is received.

Power Up ^F

- **Disable** (factory default).
- **Enable**. Selects free format mode as the power-up default and selects the graphics mode ^PY as the power-up default. Free format causes the VGL to ignore carriage returns, line feeds, and all characters below hex 20 sent from the host.

Power Up ^PY

- **Disable** (factory default).
- **Enable**. Selects the graphics mode ^PY as the power-up default.

LPI

The number of lines to be printed per inch. For example, at 6 lpi there is 1/6 inch from the top of one print line to the top of the next print line.

Graphics Options

The following are several options which configure printing output.

Slash 0

This parameter allows you to print the numeral "0" with or without the slash. This option applies to all character sets except OCR-A and OCR-B.

- **Disable** (factory default). Zero is printed without a slash.
- **Enable**. Zero is printed with a slash.

Ignore Dots

- **Disable** (factory default).
- **Enable**. Causes the VGL to expect position values to be specified in only 1/10ths of an inch. If the dot position is also given, it is treated as text.

Append Rotated

- **Disable** (factory default). Logos and alphanumeric strings are treated as separate elements.
- **Enable**. Appends logos to an alphanumeric string rotated in a clockwise, counterclockwise, or inverted orientation.
Truncate Alpha
When enabled, this parameter prevents the printing of Error 48 (Element Off Page Error) if alphanumeric data, including spaces, extends beyond the right side of the form. The options include:

- Enable (factory default)
- Disable

True Vert 1/10
- Disable (factory default). A vertical 1/10 of an inch parameter is used as 7/72 of an inch. The absolute move is slightly smaller than expected. For example, a one-inch move would be 70/72 of an inch. Vertical moves that have the same value are identical in length.
- Enable. A vertical 1/10 inch parameter is used as 1/10 inch. Rounding occurs to the nearest 1/72 inch. This can cause vertical moves that have the same value to differ by ± 1/72 inch.

Absorb After ^PY
- Absorb Motion (factory default). The first paper motion following a ^PY command is ignored.
- Absorb All. The system ignores all the data and terminator until a host generated motion terminator is detected.
- Disable. System terminators following a graphics command are sent to the printer and result in paper motion.

UPC Descenders
- Enable (factory default). UPC/EAN barcodes are printed with descenders, even if there is no human readable data.
- Disable. UPC/EAN barcodes are printed without descenders if there is no human readable data.

Rot. Char Size
- Adjusted (factory default). Rotated (clockwise/counterclockwise), expanded characters have a different size than an unrotated character with the same size parameters.
- Not Adjusted. Rotated, expanded characters are the same size as unrotated characters with the same size parameters.

Ignore Spaces
- Disable (factory default). Trailing spaces are not deleted from the last alphanumeric element in a graphics pass.
- Enable. Trailing spaces are deleted from the last alphanumeric element in a graphics pass.
Midline PY (includes ^PN)

- **Disable** (factory default). The Graphics mode Enable command, ^PY, must be the first three characters of a line.
- **Enable**. The ^PY or ^PN can occur anywhere in a line.

Print Quality

- **Data Processing** (factory default). ALPHA text and barcodes are printed in normal mode at 60 x 72 dpi. This mode should be set if the highest speed is desired.
- **High**. ALPHA text and barcodes are printed in dark mode at 120 x 72 dpi.

Expanded Font

- **Scalable** (factory default). These expanded characters have rounded edges.
- **Block**. These are block characters compatible with IGP-X10 printers.

LP+ Font

- **Disable** (factory default). The IGP/VGL uses its default half-dot font, which is slightly different from the standard bitmap font used by LP+ at 12, 13, 15 and 17 cpi.
- **Enable**. The IGP/VGL uses the same font as used by LP+ at all cpi.

MSI Check Digit

- **Print** (factory default). The check digit is appended at the end of the printable data field for MSI barcodes.
- **Don't Print**. The check digit for MSI barcodes does not print.

I25 Selection

- **I25 Odd Data** (factory default). When an odd number of data is provided, the default setting, Leading Zero, will add a zero to the beginning of the bar code data. The setting, Check Digit, will add a check digit to the end of the bar code data so that the results add up to an even number of data.
- **Convert Alpha**. Disable is the default. When enabled, each non-digit I25 bar code character will convert to “0.”

**NOTE:** If you use an Interleaved 2/5 barcode that automatically adds the check digit (type code k or l, IBARC type code INT2/5CD or INT2/5CDA), the check digit is added regardless of how this parameter is set.
**AI 00 Spaces**

This option is designated for EAN/UCC-128 barcodes whose application identifier (AI) is 00.

- **Disable** (factory default). The printable data field is printed with the AI enclosed in parentheses. This is the standard EAN/UCC-128 format.
- **Enable**. The printable data field is printed with the UCC fields separated by spaces. This option is IGP-X00 compatible.

**Width Limit**

- **Disable** (factory default).
- **Enable**. The system will limit the length and width for expanded characters to a limit shown in Table 10, which displays the maximum width allowed for a specific height in the range of 00 through 40 (0.0 through 4.0 inches).

</tbody>
</table>

**Absorb After ^PN**

- **Disable** (factory default). All line terminators that follow the ^PN command are sent to the printer and processed.
- **Enable**. The first motion line terminator that follows the ^PN command is ignored.
IGP110 Compatbl.

This option instructs the VGL to behave similarly to the IGP-10 with respect to certain commands. All new users with new applications should select the “Disable” option. Selecting this mode insures the printer will behave as described in this manual.

- **Disable** (factory default). The IGP does not emulate the IGP-10 mode.
- **Enable**. The IGP emulates the IGP-10 version.

Auto FF at ^PN

- **Disable** (factory default). A form feed will not be generated automatically when the ^PN command is encountered.
- **Enable**. A form feed will be generated automatically to slew to the top of the next form when the ^PN command is encountered and when the current vertical position is not at top of form.

PDF Size Comp.

This option is for compatibility of the font size of the barcode printable data field on the old build.

- **Disable** (factory default). Uses the normal font size.
- **Enable**. Matches the font size of the old build.

C128 Mode Comp

The menu is for compatibility of the old build in auto mode switch.

- **Disable** (factory default). Uses auto mode switch.
- **Enable**. Matches the old build on the auto mode switch.

C39 Compatbl.

This menu makes the old method of decoding C39 alternative character set compatible with the new.

- **Disable** (disable). Uses the current way of decoding.
- **Enable**. Matches the old method of decoding.

Ignore ^Lxx Cmd.

- **Disable** (factory default).
- **Enable**. The ^Lxx command will always be ignored.
Error Handling
Following are several options which define how errors are reported.

Error Msgs
- **Enable** (factory default). Command syntax is checked and error messages printed when command parameters are incorrect.
- **Disable**. Error checking and error messages are suppressed.

Error Markers
- **Enable** (factory default). Prints the following error markers for those elements that print beyond the page boundaries:
  - >> for elements that begin off the right side of the page;
  - << for elements that begin at the indicated position but end off the page;
  - ♦ for elements where the starting position of the command contains an error other than an off-page error.

Offpage Errors
- **Disable** (factory default). Does not report errors for elements that start or end beyond the right edge of the page.
- **Enable**. Reports errors for elements that start or end beyond the right edge of the page.

Barcode Errors
- **Enable** (factory default). An error message will print when invalid barcode data is encountered.
- **Disable**. VGL will not print an error for illegal barcode data; the barcode will be skipped.

**NOTE:** When the Barcode Errors option is disabled, the VGL emulation will try to make the best use of invalid data by either truncating extra digits or adding zeros to the end of barcode data to meet minimum data length requirements for some barcodes. Not all errors will be corrected.

Ignore / DB8 Setup
Following are several options which define character filtering and Data Bit 8.

Ignore Chars
- **Disable** (factory default). Character filtering is not enabled.
- **Char 1**. Character 1 will be filtered. Select the option “Ignore CH#1” to specify character 1.
- **Char 2**. Character 2 will be filtered. Select the option “Ignore CH#2” to specify character 2.
- **Char 1 & 2**. Characters 1 & 2 will be filtered. Select the options “Ignore CH#1” and “Ignore CH#2” to specify values for these characters.
Ignore CH#1

Specifies character 1 for the character filtering option. Valid decimal values are from 0 through 255.

Ignore CH#2

Specifies character 2 for the character filtering option. Valid decimal values are from 0 through 255.

Data Bit 8

- **Enable** (factory default). The PI line is not passed directly from host to printer; all 8 bits are used for data bits, and characters in the hex 80-FF range can be accessed.
- **Disable**. When the host PI line is enabled, Data Bit 8 internally indicates PI line status. To use the PI line, disable Data Bit 8, and enable the Host PI configuration option (under the PI Control option, below).

**NOTE:** Data Bit 8 is interpreted as either Data Bit 8 or PI signal, but never both. When enabled as Data Bit 8, Data Bit 8 has priority over the PI signal, and all data above hex 7F is used to access character data and not to interpret PI line data.

Conversely, when Data Bit 8 is disabled and the PI signal is used, Data Bit 8 of the data is reserved for use as the PI function, and you cannot access characters in the hex 80-FF range. Therefore, to access characters in the hex 80-FF range, Data Bit 8 must be enabled.

Font Set

The Font Set specifies which language is currently selected for use with the VGL. Refer to “IGP/VGL Font Set Menu” on page 184 for available selections.

PI Control

Printer PI

- **Disable** (factory default). The ASCII emulation is configured with the PI line disabled.
- **Enable**. The ASCII emulation is configured with the PI line enabled.

Host PI

- **Disable** (factory default). The host does not send PI signals.
- **Enable**. The host sends PI signals. The Data Bit 8 configuration option must be disabled to transmit the PI line to the printer.
Max PI 16

- **Enable** (factory default). A paper slew of 0-15 will move 1-16 lines.
- **Disable**. A paper slew of 1-15 will move 1-15 lines. A paper slew of 0 will always move 1 line.

**Prt To Emulate**

This option allows you to select an earlier model printer/IGP board combination to emulate. When a printer emulation is selected, the scaling command causes the printer to generate a graphic image in the same density as the printer emulation chosen. Five types of printers can be emulated: MVP or MVP 150B, L150, P3040, P6000, and P9000. Once a printer emulation is selected, it remains active until the printer is turned off or another printer emulation is selected. All new users with new applications should select the “Disable” option, which insures the printer behaves as described in this manual. The other compatibility modes are required to emulate the behaviors of older printers which may be inconsistent with the documented VGL functionality. Proper use of this feature requires the printer to be equipped with high resolution hammer bank tips (12 mil).

* Factory Default
A general discussion about starting and stopping IPDS can be found in the IBM 4234 Product and Programming Reference Manual (GC31-3879). Sending a non-IPDS data stream to an IPDS printer and vise versa will result in a hung spool file or writer.

Font Size

This parameter chooses the font size which will be used by IPDS.

- **Select By Host** (factory default). The font ID is only affected by host commands.
- **Standard**. The font ID is converted to a decompressed font ID.
- **Compressed**. The font ID is converted to a compressed font ID.

Print Quality

This parameter chooses the print quality.

- **Select By Host** (factory default). The application decides the print quality.
- **Default Font**. The default font the printer uses.
Graphics Quality
This parameter chooses the print quality of graphics.

- **High** (factory default). Graphics are printed at 144 dot rows per inch.
- **Select By Host**. The application decides the quality of the graphics.
- **Low**. Graphics are printed at 72 dot rows per inch.

Barcode Quality
This parameter chooses the horizontal print quality of barcode labels.

- **High** (factory default). Label is printed at 144 dots per inch.
- **Select By Host**. The application decides the quality of the labels.
- **Low**. Label is printed at 72 dots per inch.

Barcode Speed
This parameter chooses the vertical print quality of barcode labels.

- **High** (factory default). Barcodes are printed with less vertical dots, increasing printing speed, but decreasing print quality.
- **Select By Host**. The application decides the quality of the labels.
- **Low**. Barcodes are printed with more vertical dots, decreasing printing speed, but increasing print quality.

Barcode Size
This parameter will emulate the barcode sizes of the selected printer model.

- **4234** (factory default). IBM 4234
- **67XX**. Decision Data 67XX
- **64XX**. IBM 6400 series
- **4224**. IBM 4224

Early Print Comp (Complete)
This parameter chooses when to send a Print Comp to the controller.

- **Off** (factory default). Print Comp is sent if page is printed completely.
- **On**. Print Comp is sent immediately. The next page will be created. This improves the print performance when starting the next page.

**NOTE:** When Early Print Comp is enabled and an error occurs, you may lose data.
Graphics Scaling
This parameter chooses the scaling factor for graphics when the Mapping Control option of the IPDS Write Graphics Control command is SCALE TO FIT:

- **Rounded** (factory default). Calculations are rounded up in the desired output resolution.
- **Exact**. Graphics will be scaled as accurately as possible.

Graphic CharSize
This parameter will emulate the graphic character size of the selected printer model.

- **4234** (factory default). IBM 4234
- **67XX**. Decision Data 67XX

I2/5 Checksum
This parameter defines the printer checksum calculation method for Interleaved 2 of 5 barcodes.

- **Standard (1/3)** (factory default). The odd numbers will be multiplied by 3 and the even numbers by 1 for calculation of the checksum.
- **Special (4/9)**. The odd numbers will be multiplied by 4 and the even numbers by 9 for calculation of the checksum.

**NOTE:** “Odd” refers to the 1st, 3rd, 5th... character in the barcode, while “even” refers to the 2nd, 4th, 6th... character in the barcode.

Default Code Page
Choose which code page to use with the IPDS emulation.

Code Page Subset
When the Thai code page is selected as the default, either from the front panel or by a host command, you may choose from three different versions.

Default Font
Choose a font quality and size from the available selections. All fonts in the Default Font menu are available in standard and compressed vertical resolution (see page 185).

VPA Check
- **Enable** (factory default). The printer checks for dots that fall outside the intersection of the logical and physical pages. If dots fall outside the area, the printer reports an error to the host if the IPDS Exception Handling Control command setting requires error reporting.
- **Disable**. The printer does not report dots outside the valid printable area.
Hexdump Mode

A hex code printout (or hex dump) translates all incoming data to hexadecimal equivalents. A hex dump lists each ASCII data character received from the host computer, together with its corresponding two-digit hexadecimal code. Hex dumps can be used to troubleshoot some types of printer data reception problems.

Print IPDS Fonts

This feature allows you to print a list of all resident fonts currently available in the active IPDS emulation.

- Page L./Lines
  - 11.0 Inches*: 11.0 Inches*
  - 2.0 – 16.0 Inches: 2.0 – 16.0 Inches

- Page L./Inches
  - 11.0 Inches*: 11.0 Inches*
  - 2.0 – 16.0 Inches: 2.0 – 16.0 Inches

- Config. Print
  - Current Config: Factory Config
  - Disable
  - Power Up Config

- Symbol Set Print

- Reset Cmd CFG Ld

* = Factory Default
Primary Char. Set
You can select one of 92 pre-defined character sets by ID (although character sets range from 0 - 109, not all sets are available on the LJ500 printer), or you can select pitch, symbol set, and typeface individually. If the combination you choose matches one of the 92 predefined sets, the ID submenu will reflect that selection. If not, the ID menu will display \( xx \) to indicate that the current character set does not match a pre-defined set. Set 0 is the default, and its attributes are 10 cpi, Data Processing typeface, and Roman 8 symbol set.

Second Char. Set
Your printer can store an additional character set. To toggle between them, send the Shift In (Decimal 15, to select the Primary character set) or Shift Out (Decimal 14, to select the Secondary character set).

Page Length Rep.
- **Inches/Page** (factory default). All page length calculations are based on the inches displayed on the panel.
- **Lines/Page**. All changes in LPI or density will be changed accordingly. The length of the page is the number of lines per inch, or lpi.

For example, if the form in use is 82 lines at 6 lpi, the page is physically 13.67 inches. Since 13.67 inches is not selectable from the Length in Inches menu, change the representation to lines, then set the number of lines to 82. The inches menu will display 13.6 inches although the printer internally keeps the exact form length of 13.67 inches.

Max Line Width
Set the maximum line width at 13.2 inches (factory default) or 13.6 inches.

Face CPI Delay
Allows the combination of different font densities on the same line.
- **Enable** (factory default). Different font densities can be used on the same line.
- **Disable**. Only the same font densities are allowed on the same line.

Graphics Density
Graphics can be printed in 60 DPI (factory default) or 70 DPI.

Perforation Skip
- **Disable** (factory default). Allows printing on page perforation.
- **Enable**. You may set up a skip-over margin. For example, a skip-over margin of one inch creates a one inch margin at the bottom of the page.
Display Functions

- **Disable** (factory default). Control characters are not printed.
- **Enable**. Control characters are printed before they get executed. This is a useful debugging tool.

Line Terminator

You can define the action of the line. Four options are available: LF after CR, CR after LF, CR after FF, and CR after VT. Each of these options may be enabled or disabled independent of one another.

PTX Linefeed

- **Disable** (factory default). Linefeed is to be performed as calculated from the bottom of the graphics or barcode, thereby disrupting the vertical text alignment.
- **Enable**. The Linefeed moves to the next line as calculated from the Top of Form position, thereby retaining vertical text alignment. When printing graphics or bar codes, you may want to set the PTX Linefeed parameter to Enable to maintain text alignment.

LPI Adjust

This parameter lets you specify the lines per inch (lpi) values: 6 LPI (factory default) or 8 LPI.

Page L./Lines

This parameter lets you set physical page length in lines from 12 to 96 at 6 lpi, or 16 to 128 at 8 cpi. The default is 66 lines at 6 lpi.

**NOTE:** If 6 lpi is selected, you will be able to scroll the menu to 128 (an invalid length). However, when you press ENTER to select this value, the menu will return with the maximum lines for 6 lpi (i.e., 96 lines). Similarly, selecting too few lines for 8 lpi will cause the menu to return with 16 lines.

Page L./Inches

This parameter allows you to set physical page length from 2 to 16 inches, in increments of half an inch. The default is 11 inches.
Config Print
This option prints the emulation's parameters and the currently selected values.

Symbol Set Print
This option prints a list of all the available sets. The character set number prints to the left of the character set sample.

Reset Cmd CFG Ld
When the printer receives a host data stream reset command in addition to resetting printer variables, the selected configuration will be loaded.

- **Current Config** (factory default). If you have preset and presaved multiple configurations, then the currently selected presaved configuration is loaded when the reset command is received.
- **Factory Config**. The factory installed configuration is loaded when the reset command is received.
- **Disable**. The printer ignores the reset command when it is received and continues to use the currently loaded configuration.
- **Power-Up Config**. The power-up configuration is loaded when the reset command is received.

Font

Select a default font style and character set for the LG emulation, as follows:

- **Style.** This option allows you to specify a print quality that includes a characters per inch (cpi) and lines per inch (lpi) setting, in the format Type cpi lpi. The default setting is DP 10 6 (Data Processing, 10 cpi, 6 lpi). The print quality types you may choose from are as follows:
  - DP = Data Processing (standard quality)
  - CORESPON = Correspondence (near letter quality)
  - COMPRESS = Compressed (vertically compressed for printing long graphs and charts)
  - OCR A & OCR B = Optical Character Recognition, sets A and B
  - HS = High Speed (Draft quality for high speed printing)

- **Character Set.** This option allows you to select a character set. The character set you select can be any of the Digital Multinational sets, which include the U.S. ASCII set and several foreign language and special character sets.

Vert Forms

- **Bot Frm 66/6** (factory default). This option sets the bottom margin for the forms. You must specify the bottom margin in lines (at 6 lines per inch), ranging from 0 to 198 lines (33 inches). The default setting is 66. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. Selecting a value for this option resets the top margin to 0, so the top margin must be redefined after this option is selected.

- **Top Mrg 6/0.** This option sets the top margin for the forms. You must specify the top margin in lines (at 6 lines per inch), ranging from 0 to 198 lines (33 inches). The default setting is 0. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. The margins will automatically adjust so that the top and bottom margins do not cross each other.

- **Bot Mrg 66/6.** This option sets the bottom margin for the forms. You must specify the bottom margin in lines (at 6 lines per inch), ranging from 0 to 198 lines (33 inches). The default setting is 66. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. Selecting a value for this option resets the top margin to 0, so the top margin must be redefined after this option is selected.
Horiz Forms

- **Left Mgr 0.00** (factory default). This sets the left margin for the forms. You must specify the left margin in 1/10 inch increments, from 0 to 13.1 inches. The default value is 0. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. The margins will automatically adjust so that the left and right margins do not cross each other.

- **Right Mrg 13.2**. This sets the right margin for the forms. You must specify the right margin in 1/10 inch increments, from 0.1 to 13.2 inches. The default value is 13.2. Press the right arrow to increase the value, left arrow to decrease the value, and ENTER to change units. The margins will automatically adjust so that the left and right margins do not cross each other.

Autowrap

This parameter determines if text will wrap to the next line when the line of text exceeds the right margin.

- **No** (factory default). Any print data received past the forms width setting is discarded.
- **Yes**. An automatic carriage return and line feed is performed when data is received past the forms width setting.

CR

This option controls the action of the printer when it receives a Carriage Return code (hex 0D) from the host computer. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. Do not use this feature if the host computer sends line feeds to the printer.

- **= CR** (factory default). Does not insert an extra line feed after each carriage return.
- **= CR + LF**. If this feature is enabled, each time the printer receives a Carriage Return, it inserts an additional Line Feed code (hex 0A) into the data stream. (Do not use this feature if the host computer sends Line Feeds to the printer with each Carriage Return.)

LF

This parameter forces the printer to insert an automatic Carriage Return code into the data stream whenever a Line Feed code occurs. This can be used in most installations, but it is required if the host computer does not send carriage returns to the printer.

- **= LF** (factory default). Does not perform an automatic carriage return. The next print position will be the current print position of the next line.
- **= CR + LF**. Each time the printer receives a Line Feed, it inserts an additional Carriage Return code (hex 0D) into the data stream. This feature can be used in most installations, but it is required if the host computer does not send Carriage Returns to the printer.
FF
This parameter forces the printer to insert an automatic Carriage Return code into the data stream whenever a Form Feed code occurs. This can be used in most installations, but it is required if the host computer does not send carriage returns to the printer.

- **FF** (factory default). Does not perform an automatic carriage return. The next print position will be the current print position of the next form.
- **CR + FF**. Performs an automatic carriage return. The next print position will be print position 1 of the next form.

Unsolicited Rpt
This option enables or disables Printer Device Status Reports to be sent to the host when a reportable status or error condition has occurred.

- **No** (factory default). Disables all unsolicited status reports from the printer.
- **Small**. Enables brief unsolicited status reports and sends an extended status report to the host.
- **Big**. Enables extended, unsolicited status reports and sends an extended status report to the host.

Print Mode Opt
When enabled, this option affects the SPI, SHS, and DECSHORP commands. The printer will no longer be forced into these commands and print speed improves significantly when in portrait orientation. For SHS and DECSHORP, the character size will change with the selected pitch. In addition, SGR attributes such as bold, crossed-out, and italics, will be done in print mode with greater efficiency.

- **Enable** (factory default). Enables the print mode option.
- **Disable**. Disables the print mode option. This provides compatibility with older LG printer products.

Plot Mode Opt
When enabled, this option will plot with greater efficiency, particularly with respect to the Postnet barcode. Postnet is printed in the same density as the current print mode font so that reverse motion will be inhibited when possible.

- **Enable** (factory default). Enables the print mode option.
- **Disable**. Disables the print mode option. This provides compatibility with older LG printer products.

I-2/5 Guard Bars

- **Enable** (factory default). Horizontal guard bars are printed above and below each Interleaved 2/5 bar code. This option only applies to Interleaved 2/5 bar codes.
- **Disable**. Interleaved 2/5 bar codes are printed normally, with no guard bars.
Postscript/PDF Interpreter

The Postscript/PDF data is handled by Ghostscript by Artifex, an interpreter compatible with the following:

- Portable Document Format ("PDF") 1.0, 1.1, 1.2, 1.4, 1.5, and 1.6 as defined in the Portable Document Format Reference Manual, distributed by Adobe Systems Incorporated.

Ghostscript includes a set of 35 scalable outline fonts in PostScript Type 1 format, compatible in appearance and metrics with the fonts commonly distributed under the following names:

- Bookman (demi, demi italic, light, light italic)
- Courier (plain, oblique, bold, bold oblique)
- Avant Garde (book, book oblique, demi, demi oblique)
- Helvetica (plain, oblique, bold, bld oblique narrow, narrow oblique, narrow bold, narrow bold oblique)
- Palatino (roman, italic, bold, bold italic)
- New Century Schoolbook (roman, italic, bold, bold italic)
- Times (roman, italic, bold, bold italic)
- Symbol
- Zapf Chancery (medium italic)
- Zapf Dingbats

The Ghostscript version used in the P8000 is 8.71.

**Resolution**

This parameter defines the default print resolution. This selection is used when either the print resolution is not defined by the data stream or if the print resolution defined by the data stream is not supported.

The following resolutions are available on OpenPrint P8000 Standard products:

- **120x144 DPI** (factory default)
- **90x96 DPI**

The following resolutions are available on OpenPrint P8000 HD products:

- **180x180 DPI** (factory default)
- **180x90 DPI**
- **90x180 DPI**
- **120x120 DPI**
- **90x90 DPI**
Paper Size

This parameter allows selection of available paper sizes. This parameter should be set according to the dimensions of the physical paper installed in the printer. This parameter will be used to determine the TOF and is expected to change when new media is installed. Available options include:

- **Custom.** Sets a user-defined paper size.
  - **Width.** Defines the paper width. The range is 1” to 15” in 0.1 inch increments. The default is 13.6 inches.
  - **Length.** Defines the paper length. The default is 11 inches. Three length options are available:
    - **Inches.** Defines the length in inches. The range is 1” to 24” in 0.1 inch increments.
    - **1/6 Inch Lines.** Defines the length in 1/6 inch lines. The range is 6 to 144 lines.
    - **1/8 Inch Lines.** Defines the length in 1/8 inch lines. The range is 8 to 192 lines.

To set a custom length, use the appropriate menu that allows for selection of the exact paper length to avoid loss of top-of-form (i.e., if using a 12” paper, select either the “Inches” menu set to 12” or the “1/6 Inch Lines” menu set to 72. However, if using a 11 2/3 inch paper length, the “1/6 Inch Lines” menu must be used (set to 70) since that is exactly 11 2/3 inches. If the “Inches” menu is used, the closest values would be 11.6 or 11.7 inches which are not exact.

The printer will indicate which of the three length menus was used by showing that submenu first when entering the “Length” menu. The configuration printout will also show the length menu used.

- **See Table 4 for paper size options and actual sizes.**

</table>
NOTE: When host jobs have page sizes that do not match the Paper Size parameter, the printer will behave based on the Paper Size Fault, Clip Page, and Move to TOF parameters.

**Paper Size Fault**

If a page is sent to the printer with dimensions that do not match the printer, then the following will happen based on the Paper Size Fault menu selected.

- **Ignore** (factory default). The page will print and the paper size length will be ignored. However, the width will be clipped according to the front panel width setting.
- **Fault**. The printer enters a fault state and goes offline. The user will need to either clear the fault and continue, or load new media and change the Paper Size menu selection. Once the printer is back online, printing will resume.

**Clip Page**

This menu defines the action when a page is sent to the printer with a length that is longer than the selected paper size length.

- **Enable** (factory default). The page will be clipped at the paper size length. In cases where the sent page is longer than the paper size length, the “Move to TOF” menu setting has no effect since the page is clipped at the TOF position.
- **Disable**. The page will not be clipped and printing continues on the next page. The action taken by the printer when printing of the page completes is determined by the Move to TOF menu.

NOTE: Page clipping at paper size width is always enabled to protect against printing on the platen.

Move to TOF

When the page length given does not match the printer, the printer driver will have to determine how the TOF is kept relative to each page printed. The following menu options are available through the front panel and the driver:

- **Disable.** Only when the FF key is pressed.
- **At End of Job.** After the Current Job.
- **At End of Page** (factory default). After each Page Printed.

Gray Adjust

This menu adjusts the darkness of the gray elements on the page by gradually reducing or increasing the amount of dots that are placed in the halftone patterns. Pure white and black colors are not affected by setting.

The menu ranges from -10 to +10. The default value is 0.
Chapter 4 PRINTER CONTROL Menu

PRINTER CONTROL Menu

* Factory Default
1 Not available in LG or PCL-II
2 Available for Pedestal printers only.
3 Not available when Postscript/PDF is active.
4 Available for Zero Tear Pedestal printers only.
5 Availability based on Firmware type.

- 7.15 inches
- (4.5 – 15.5)
ZTP SETTINGS
Refer to the “ZTP SETTINGS” menu section in Appendix C, page 305. This menu will only appear for Zero Tear Pedestal printers.

Ribbon End Point
This parameter adjusts the point at which the system will declare the ribbon as being expended. The life count will always be from 100% to 0%, but if a darker setting is selected 0% will be reached more quickly. If a lighter setting is selected, the system will extend the time it takes to reach 0%. The range of values are as follows:

- Normal (factory default)
- Darker +1 through Darker +6
- Lighter -1 through Lighter -10

NOTE: This value can be adjusted at any time and the display will automatically adjust to show the correct percentage relative to the new end point.

Open Platen @ BOF (Bottom of Form)
Some special forms have perforation areas that are too thick to pass through the print station. This parameter, when enabled, opens and closes the platen when the perforations move across the platen. When enabling this parameter, you must set the forms length to match the physical distance between perforations.

Bar Code Quality
Determines the bar code resolution for all emulations, except IPDS. (See “IPDS Emulation” on page 185 to set the bar code quality for IPDS.)

- Dark (factory default). Bar code resolution is set at 120 x 72.
- Draft. Bar code resolution is set at 60 x 72.

Tear Bar Dist. (Distance)
Allows fine and course adjustment of the tear bar position. For a pedestal model printer using the top paper exit, the default (7.15 inches) is used. You can specify 4.5 to 15.5 inches in .01 inch increments to accommodate variations in cover and form design.

View Function

- Disable (factory default). Disables the View Function which allows you to press the VIEW key to move the last data printed to the tractor area for viewing.
- Enable. Enables the View Function.

NOTE: Default setting is Enable for Indian language printers.
Unidirectional

The Unidirectional feature affects both print quality and printing speed. By setting this feature, you can configure the printer to print in both directions of the shuttle sweep (bidirectional), or to print in one direction only (unidirectional).

- **Disable** (factory default). The printer will print all data in both directions of the shuttle sweep (bidirectional printing). This choice produces higher printing speed.
- **Enable**. The printer will print all data in only one direction of the shuttle sweep (unidirectional printing). Although enabling this feature reduces print speed, it enhances the vertical alignment of dots and produces cleaner, sharper barcodes and text.

Display Language

This parameter chooses the language that will appear on the LCD: English, German, French, Italian, Spanish, Portuguese, Simp. Chinese, Trad. Chinese, or Korean. The factory default is English.

**NOTE:** Simp. Chinese, Trad. Chinese, and/or Korean are not available on all firmware versions.

Panel Display

This menu allows the user to customize the type of information that will display on the panel LCD when the printer is in online mode.

- **Ribbon Life** (factory default). The LCD displays the ribbon life for the current cartridge installed.
- **Configuration**. The LCD displays the configuration that was last loaded.
- **IP Address**. The LCD displays the printer IP Address for networked printers.

Accented Char

Selects whether the accented characters are standard or tall. See Figure 23 for an example. Selecting tall will slow print speed and may cause the printer to back up during printing.

Optimize Barcode

Defines whether the barcode optimization feature is active.

- **Yes** (factory default). Activates the barcode optimization feature.
- **No**. Deactivates the barcode optimization feature.
- **Test**. Boxes will print around all barcodes that are detected and replaced. This provides a simple method to confirm that the software correctly detects and replaces all the barcodes on any given form.
Alignment

Defines how the optimized replacement barcode will be positioned with regard to the original barcode position if no obstacles exist to this placement. It defines the first attempted position of the replacement barcode. If the first attempted position causes a replacement barcode to interfere with any other form elements (text, graphics, or dots), the replacement barcode automatically adjusts away from these interfering elements until requested horizontal quiet zones are observed. Selections for this menu are as follows:

- **Left.** The first attempted position of the leftmost bar of the replacement barcode will be the same position as the leftmost bar of the original barcode. For instance, if the replacement barcode is smaller than the original barcode, it will be placed as follows:

```
Replacement Barcode
```

```
Original Barcode
```

If the replacement barcode is larger than the original barcode, the replacement barcode will begin at the left edge of the original barcode and expand beyond the right edge.

```
Replacement Barcode
```

```
Original Barcode
```
Any form elements (text, graphics, or dots) immediately to the right of the original barcode can force this first attempted placement to be modified. The replacement barcode will shift left to avoid obstacles on the right provided that there are also no obstacles on the left.

- **Center** (factory default). The first attempted position of the center bar of the replacement barcode will be the same position as the center bar of the original barcode.

If the replacement barcode is smaller than the original barcode, it will be replaced as follows:

If the replacement barcode is longer than the original barcode, it will still be centered, but it will extend beyond the end of the original barcode on both the left and the right.
If form elements interfere with this placement on the right or the left, the barcode will automatically adjust away from these obstacles. Form obstacles may force a center-aligned barcode to look left or right aligned. For instance, in the below picture, a center-aligned barcode has text 0.2 inches away from the right edge of the original barcode. With a horizontal quiet zone of 0.2 inches, the resulting replacement barcode position is exactly the same regardless of whether center, right, or left alignment is chosen. Regardless of the first attempted position, the barcode will need to shift to the left until the horizontal quiet zone can be observed.
- **Right.** The first attempted position of the rightmost bar of the replacement barcode will be the same position as the rightmost bar of the original barcode.

For instance, if the replacement barcode is shorter than the original barcode it will be placed as follows:

If the replacement barcode is larger than the original barcode, the replacement barcode will end at the right edge of the original barcode and extend past the left edge. Any form elements (text, graphics, or dots) immediately to the left of the original barcode, however, can force this first attempted placement to be modified. The replacement barcode will shift right to avoid obstacles on the left provided that there are also no obstacles on the right.
**Hor. Quiet Zone**

This menu defines the quiet zones (empty areas) width before and after the start/stop codes regardless of picket fence or ladder orientation. When positioning the barcode, the quiet zone is taken into account when detecting collisions with other elements (dots) on the form. If one of the horizontal quiet zones is violated, the barcode will automatically shift to the left or right (for picket fence orientation) or up or down (for ladder orientation) to remove the quiet zone violation.

The width of the area can be defined between 0 and 0.99 inches in 0.01 inch increments. The default is 0.20 inches. This feature ensures that the replacement barcodes will be properly scanned.
**Ver. Erase Zone**

This menu defines the area above and below the bars that will be erased, regardless of picket fence or ladder orientation. It is used when the barcode has extraneous data beyond the bars that need to be deleted as it is being replaced.

The height of the area can be defined between 0 and 0.99 inches in 0.01 inch increments. The default is 0 inches (no empty space). This feature can be used to remove special attributes remainders of the original barcode such as a guard bar or line that borders the top and bottom of the bars. It can also be used to erase the original PDF if the user wants to force all PDFs to be replaced (see Update PDF on page 216). The PDF occupies more than 1/6 of an inch.

**Quiet Zone Fault**

This menu defines whether a fault must be reported on the front panel LCD if the BCDOPT feature cannot print the replacement barcode without violating the quiet zone as defined in the “Hor. Quiet Zone” menu, where the width of the replacement barcode plus quiet zones is too large to fit the available white space on the page.

- **Enable** (factory default). If this fault occurs, reduce the quiet zone to see if the barcode fits.
- **Disable**. Quiet zone violations are not reported, but adjacent page elements could be drawn too close to replacement barcodes and possibly overlap.
Update PDF

There are two distinct cases with barcode PDFs. In the first case, the PDF is partially embedded in the barcode such that erasing the bars also erases the PDF. In the second case, the PDF is printed entirely above or below the barcode and is not disturbed by the barcode replacement.

Whenever the PDF is embedded in the barcode such that erasing the bars also erases the PDF, the embedded PDF will be automatically detected and replaced. An area surrounding the barcode will be erased to remove the portions of the former PDF that extended beyond the bounds of the original barcode. The erase area is shown in the figure below. Since embedded PDFs are automatically replaced, the Update PDF menu option has no effect on this type of PDF.

When the PDF is printed above or below the barcode, the behavior will depend on the Update PDF menu setting.

- **Embedded Only** (factory default). Embedded PDFs will not be replaced. This allows the user to keep the present PDF data and its font, etc.

- **Always**. PDFs will always reprint. For instance, since the original PDF will not be centered with respect to the replaced barcode, the user may want to always replace the PDF. When set to Always, an extra 1/6" is erased to remove the original PDF. If the original PDF is not fully erased, it is up to the user to increase the Ver. Erase Zone setting such that the original PDF will be completely erased prior to the replacement being printed.
Barcodes on Page
This setting defines the number of barcodes that must be detected on the form. If the value is set to “Auto” (factory default), no particular number of barcodes are required to be detected. If the value is set to a number between 1 to 20, then the number of barcodes set is required to be detected on each form. If the printer detects fewer barcodes than the value set, the fault “x/y BARCODES / Not Found” is declared. x represents the number of barcodes not found, and y represents the Barcodes on Page value. Printing will not continue until the user clears this fault.

Bcodes Optimized
This is a display menu that continuously counts the number of barcodes that have been optimized since power-up. This statistic only resets to zero when the printer is powered off. This menu can be used as a diagnostic to check the number of barcodes optimized over a period of time or over a batch file.

PTX_SETUP Option
Selects the Special Function Control Code for the PTX_SETUP command and functions.

- **Setup Parse.** Disables or enables the PTX_SETUP command.
- **Setup SFCC.** Allows you to choose the hex value of the ASCII character you wish to use as the SFCC for the PTX_SETUP command. Valid hex values are 01-FF. The default value is hex 21, which corresponds to the “!” character.

Hex Dump Mode
A hex code printout (or hex dump) translates all incoming data to hexadecimal equivalents. A hex dump lists each ASCII data character received from the host computer, together with its corresponding two-digit hexadecimal code. Hex dumps can be used to troubleshoot some types of printer data reception problems. The options include:

- **Disable** (factory default)
- **Enable**

Figure 26 on page 247. shows a hex dump sample.

Power-Up State

- **Online** (factory default). The printer powers up in the online state.
- **Offline.** The printer powers up in the offline state.

**NOTE:** This option is not available in the PCL-II or LG emulation.
Downloaded Fonts

Allows you to download a substitution table to replace any character in the current character set with a different character in the same font. The Downloaded Fonts menu applies to both LP+ Bitmaps and IGP Block downloaded characters. For example, performing a Delete from Flash option deletes both Bitmap and Block downloaded characters from flash memory.

- **Char Operations.** Allows you to delete a character from flash, load a character from flash, save a character to flash, and delete a character from RAM.
- **Ld Char at Pwrup.** Allows you to disable or enable loading a character at power up.
- **Set Operations.** Allows you to delete a character set from flash, load a character set from flash, save a character set to flash, and delete a character set from RAM.
- **Ld Set at PwrUp.** Allows you to disable or enable loading a character set at power up.

**NOTE:** This option is not available in the PCL-II or LG emulation.

- **DBCS Download.** Allows you to save and delete downloadable DBCS characters from flash.
  - **Save to Flash.** Saves the downloaded characters from the DRAM to FLASH memory. These characters can be automatically reloaded when the printer powers on. The saved file name is “dbcsdwn”. The characters need to be in the DRAM prior to saving into FLASH memory by using any download commands.
  - **Delete DL. Font.** Deletes the “dbcsdwn” file. The downloaded characters will no longer reside in FLASH memory on subsequent power-ups.

PMD (Paper Motion Detection) Fault

- **Enable** (factory default). In the event of a paper jam, an audible alarm beeps, “CLEAR PAPER JAM” appears on the message display, and the printer stops printing.
- **Disable.** You should disable PMD only if special paper requires it.

**CAUTION** Once PMD is disabled, paper motion is not monitored. If a paper jam occurs, the printer ignores the condition and continues to print, possibly causing damage to the printer.

Power Stacker

This parameter allows you to enable or disable the power paper stacker (provided this option is installed).
Auto Elevator

This parameter exists only on printers with the power paper stacker installed. The power stacker has a sensor which detects paper movement and raises the stacker as the printed paper stack grows. If the printer has been printing for three minutes continually and the sensor has not detected any growth in the paper stack, the stacker raises itself 1/4 inch automatically.

- **Enable** (factory default). The automatic elevator on the power stacker operates normally.
- **Disable**. The stacker does not raise automatically every three minutes and is entirely dependent on the sensor. Disable is used with extremely high-quality print jobs that take a long time to print.

Auto Locking

- **Disable** (factory default). The ENTER key must be locked manually.
- **Enable**. The printer automatically locks the ENTER key five minutes after the last front panel key press.

Main File System

The Main File System refers to the flash resident on the P8000 controller.

- **Overwrite Files**. Allows you to prevent flash files from being overwritten by disabling the overwrite function.
- **View File List**. Displays the list of flash files in the main file system. Press the ENTER key to go into the submenu. Then press the UP or DOWN keys to view the different file names and size.
- **Delete Files**. Displays the list of flash files in the main file system. Press the LEFT or RIGHT keys to select the desired file to delete. Pressing the ENTER key deletes the file displayed on the control panel.
- **Flash Avail**. The amount of flash available for the user to save or download files into the main file system.
- **Flash Reclaimable**. The amount of flash marked deleted, but cannot be used until the Optimize&Reboot operation is performed.
- **Copy To SD**. If the SD card is inserted, the section will allow the user to copy selected files from the main file system to the SD card (root directory).
- **Optimize&Reboot**. Reclaims flash space from deleted flash files within the main file system. After pressing ENTER, wait for the printer to reboot.

**NOTE:** When the Optimize&Reboot option is executed, the message, “Optimizing Flash Files” does not display before printer rebooting takes place.

- **Print File List**. Prints a summary of the flash files stored in flash memory and several statistics on Main File System usage.

**IMPORTANT** Do not turn the printer off until it has completely rebooted and is either back online or offline.
SD File System

The SD File System menu appears if an SD card is inserted in the printer before power-up. The SD File System applies only the SD card’s root directory.

**IMPORTANT** If you remove or insert the SD card after the printer is powered on, an error will occur.

- **Overwrite Files.** Prevents SD files from being overwritten by disabling the overwrite function.
- **View SD Files.** Displays the list of files on the SD card (root directory). Press the ENTER key to go into the submenu, then press the UP or DOWN keys to view the different SD file names and size.
- **Delete SD Files.** Displays the list of SD files on the SD card (root directory). Press the LEFT or RIGHT keys to select the desired file to delete. Pressing the ENTER key deletes the file displayed on the control panel.
- **SD Flash Avail.** The amount of SD memory available for the user to save or download files into the SD card.
- **Copy From SD.** Copies selected files from the SD card (root directory) to the Main File System.
- **Print File List.** Prints a summary of the files stored on the SD card (root directory) and several statistics on the SD File System usage.

Set Sharing

This option allows character sets to be shared between the active LP+ protocol and the active IGP emulation.

Changing characters sets in LP+ causes the active IGP to change to the same character set if the selected set exists in IGP. If the active IGP has no access to the selected set, no changes are made. Selecting a new character set in the active IGP causes the LP+ to change to the same character set if the selected character set exists in the active LP+ protocol. Not all sets are shared between emulations in the Standard group of character sets. As a result, selecting a set in the Standard group of LP+ or IGP emulation may or may not cause the other emulation to have the same set.

**NOTE:** The Set Sharing front panel option has no effect on the LP+ build. The option only applies to the builds with IGP.

This option is not available in the PCL-II or LG emulation.

Shuttle Timeout

The amount of time the shuttle continues moving after no data is received. If your host is slow, setting the number to a higher value will prevent the printer from spending time shuttling up and down between data bursts.
Sure Scan Submenu

Slow Paper Slew
- Disable (factory default). The paper will slew and stack paper at maximum speed.
- Enable. Causes the paper to stack at a slower rate. This ensures that certain forms will stack neatly.

Alarm
- On (factory default). An audible alarm sounds (3 beeps) when a fault occurs, such as a paper jam.
- Cont. Beep. A continuous audible alarm sounds when a fault occurs, which can be stopped by pressing CLEAR.
- Off. No audible alarm will sound.

Power Saver Time
The time interval you specify for this parameter sets the amount of idle time before the printer goes into Power Saver mode. When Instant is chosen, the printer goes into Power Saver mode as soon as it is able to stop the shuttle properly. The time allotted to perform this function depends upon the shuttle timeout value which can be set in the menu.

NOTE: Power Saver Mode will not be shown on the control panel even though the function still exists. Sending a print job to the printer will turn off Power Saver mode.

Pwr Save Control
Allows you to enable or disable the Power Save (Energy Star) mode.
- Enable (factory default). Allows you to enable the Power Save (Energy Star) mode.
- Disable. Allows you to disable the Power Save (Energy Star) mode.

Cancel Key
- Disable
- Enable (factory default). The CANCEL key may be used to clear all data in the print buffer without printing any of the data.

Rcv. Status Port
This option defines the interface being used to receive the emulation status command.
- Automatic (factory default). When selected, the status command is sent to the printer with the print data through the active host interface.
- Serial. When selected, the status command is sent to the printer through the serial interface regardless of the active host interface.
Ret. Status Port

This option selects the port for the Return Status Commands (i.e., ~STATUS for PGL) to send the status data back to the Host.

The options are Automatic (factory default), Serial, USB, E-NET Stat Port, IEEE 1284, Disable, and E-NET Data Port.

Set Lock Key

Normally, to lock or unlock the printer menu, the UP and DOWN keys are pressed at the same time. The Set Lock Key parameter lets you choose different keys to lock or unlock the printer menu. You may choose almost any group of keys as the new lock and unlock keys. You cannot use the ENTER key or any key combinations which are already used for another function. There is no limit to how many keys you can select.

To set the new lock key, follow these steps:

1. Work your way through the configuration menu until the display reads “Set Lock Key” (follow the menu structure on page 207).
2. Press ENTER. The display reads, “Select a new lock key.”
3. Press the combination of keys you want to be the new lock key. Make sure you press all keys selected at the same time.
4. If the selection is valid, the display will read, “Enter the new lock key again.” If the selection is invalid, the display will read, “Invalid key selection.” Return to step 2 and start over.
5. Press the same combination of keys a second time. If the new lock key combination is entered again correctly, the display will read, “Lock key has been changed.” If it was entered incorrectly, the display will read “Verification failed.” Start over at step 2.
6. After entering the new lock combination successfully, press the ONLINE key to put the printer back online.

NOTE: The new lock combination will remain even if the printer is powered off and back on.

Job Sel/Typeface

NOTE: For H-Series printers only.

This option allows the user to change the printer’s active configuration or typeface in Offline mode.

- **Job-Select On** (factory default). Allows the user to change the printer’s active configuration.
- **Typeface On**. Allows the user to change the printer’s typeface.

Print Hist. Log

NOTE: For H-Series printers only.

Checks the status of user downloaded font files in the build.
SURE SCAN Submenu

RBN Low Warn @
This option allows the user to select the Ribbon Life value at which point the printer will declare a ribbon low condition and display the "RIBBON UNDER XX% / Change RBN Soon" warning message. The default is Under 2%. See “RBN Low Action” below for details of how the printer behaves once a ribbon low condition is reached.

The values are Under 2% (factory default), Under 5%, Under 10%, Under 20%, and Under 30%.

RBN Low Action
This menu determines how the printer behaves once a ribbon low condition is reached.

• **Warn & Continue** (factory default). Once a ribbon low condition is reached the printer beeps and displays the "RIBBON UNDER XX% / Change RBN Soon" warning message. Printing will continue without interruption. The warning message can be cleared by pressing the ONLINE/Clear button, however the message will persist again in two minutes. This action will continue until a ribbon out (ribbon life reaches 0%) condition occurs.

• **Warn & Pause**. This setting is similar to the Warn & Continue selection with one exception. When a ribbon low condition is reached the printer will still display the "RIBBON UNDER XX%/Change RBN Soon" warning message, however the printer will stop printing. This is meant to get the user’s attention. To resume printing the user must press the ONLINE/Clear key.

**NOTE:** Printing will only stop on the first occurrence of a ribbon low condition. Once the user clears the warning message, subsequent warnings will display the warning message but printing will continue.

RBN End Action
This menu allows the user to override the normal ribbon low warning and ribbon out conditions.

• **Stop At RBN End** (factory default). When this factory default option is selected, the printer displays a warning message when a ribbon low condition is reached and display a ribbon out fault when ribbon life reaches 0%.

• **Ignore RBN End**. When this menu option is selected, it overrides the ribbon low and ribbon out conditions, i.e. no warning or fault messages is displayed and printing continues even after ribbon life reaches 0%. However, once the ribbon life reaches an excess wear condition as indicated by the fault message "EXCESS RBN WEAR / Install New RBN", printing will stop and the user must install a new ribbon before printing can resume.

**NOTE:** The excess ribbon wear is set below the "Lighter -10" Ribbon End Point setting.
Print Energy (1000 lpm only)

This menu allows the user to optimize energy or impact of the hammers when printing single or multipart forms.

- **Standard** (factory default). When this factory default option is selected, the printing energy is optimized for normal jobs.

- **PowerPrint**. When this option is enabled, printing is optimized for multi-part forms.

Disp. Intensity

This menu controls the intensity of the LCD display. The range is 0-20 and the default setting is 2.
**DIAGNOSTICS Menu**

(from page 67, 68, 69, 70, 71, 72 and 73.)

Printer Tests

These tests are used to check the print quality and operation of the printer.

NOTE: Your authorized service representative will typically run the tests. They are described in more detail in the Maintenance Manual.

- **Shift Recycle.** A sliding alphanumeric pattern which identifies missing or malformed characters, improper vertical alignment, or vertical compression.
- **All E’s.** A pattern of all uppercase E’s which identifies missing characters, misplaced dots, smeared characters, improper phasing problems, or light/dark character variations.
- **E’s + TOF.** A pattern of all E’s followed by a form feed to the next page top-of-form, which identifies paper motion or feeding problems.
- **All H’s.** A pattern of all uppercase H’s used to detect missing characters, misplaced dots, smeared characters, or improper phasing.
- **All Underlines.** An underline pattern useful for identifying hammer bank misalignment.
- **All Black.** A condition where all dot positions are printed, creating a solid black band.
- **Shuttle Slow.** Verifies proper operation by exercising shuttle and ribbon motion at low speed.
- **Shuttle Fast.** Verifies proper operation by exercising shuttle and ribbon motion at fast speed.
- **Shuttle Only.** Exercises only the shuttle at fast speed.
- **Phase Printer.** Checks for wavy print. The initial phase value is set in the factory. Run the test and check the quality. (The phase value prints on the left margin.) If the print looks too wavy, change the Phase Value parameter while the test is running. While the phase printer test runs, press the DOWN key. To change the value, press the PREV or NEXT key until the desired value displays and then press ENTER.
- **Paperout Adj.** Verifies the current Paper Out Dots setting, which determines where the last line of text will print when there is a paper out condition. Setting this parameter correctly prevents printing on the platen.
- **Burnin Test.** Reserved for factory use.
- **Print Error Log.** Prints the current log of errors. Most non-routine faults (ribbon stall, voltage faults) are stored in the error log.
- **Clear Error Log.** Clears entries in the error log.
- **Ethernet Test.** Prints the Ethernet statistics stored on the Ethernet (if present).
- **Acoustics.** A particular test pattern that is used to measure acoustics.
- **Demo.** Demonstration of various print attributes.
- **Dice 5.** Pattern used to measure print density.
- **Prnt Ribbon Log.** Prints log of cartridge installed in the printer.
- **Checker.** For factory use. This pattern helps identify marginal printhead elements, quality of edge sharpness, and uneven print quality.
- **Weld Patch Log.** Prints log times for ribbon starts, welds, and ribbon stops.
- **Novram Err Log.** Prints detailed information about the most recent Novram related failure that has occurred. It is useful when the front panel reports “BAD NVM” or “ILL NVM” error types. Contact the Customer Solutions Center and provide this information if such an error occurs.

**Test Width**

Set this parameter to run the self-tests at full width or 80 columns.

**Phase Value**

During the Phasing Test, this value changes until printing is phased. The range is between 1-2000.

**Paper Out Dots**

*CAUTION* Only authorized service representatives should set this parameter.

This parameter is used to adjust the paper out distance from the perforation; you can specify where the last line on the page will print when there is a paper out condition. Setting this parameter correctly prevents printing on the platen.

**System Memory**

Displays the amount of RAM installed.

**Print Statistics**

You can view various printer statistics and refer to them for preventive maintenance purposes. Printer statistics accumulate continuously; they do not reset when you turn off the printer. All of the printer statistics are set to zero at the factory after burn-in testing.

- **On.** The cumulative time in hours the printer has been powered on. The range is 0 to 30,000 hours.
- **Print.** The cumulative time in hours the printer has actually been printing. The range is 0 to 30,000 hours.
- **Print Strokes.** The cumulative number of back-and-forth shuttle strokes the printer has printed during normal printer operation. The range is 0 to 2,147,483,647 shuttle strokes.
- **Print Lines.** The cumulative number of lines the printer has printed. The range is 0 to 2,147,483,647 print lines.
- **11 inch Pages.** The cumulative number of pages the printer has printed. The range in print pages is 0 to 2,147,483,647 total inches of paper movement divided by 11.
- **Poweron Pages.** The number of pages the printer has printed since power-up.
Software Build
Displays the part number and version of the printer firmware.

Feature File
Displays the part number of the file if one has been downloaded to the printer.

Shuttle Type
Displays the type of shuttle installed, i.e. 2000s, 1500, 1000, 500, or high definition.

Auto Dump
- **Disable** (factory default).
- **Enable**. When a printer get ‘E03x’ type of message on the operator panel, a dump file will be automatically created and store in flash as file “autodbg1.dbg” or “autodbg2.dbg” in the printer file system. This file can be uploaded to the host using the PrintNet Enterprise Suite application. Upon receipt of this file, it should be sent to Printronix Customer Support for review and evaluation.

Printer Mgmt
Refer to the Printer Mgmt menu on page 229.
**Printer Mgmt Menu**

---

**PNE Port**

This menu selects which port the printer expects PNE to connect to, via Ethernet, USB, or Serial. The factory default is Ethernet. If the network is not enabled, the default is Disable.

**Mgmt Protocol**

Since PXML and UCP management protocols share the same Ethernet Port, only one can be active at a time. This menu selects the active Management Protocol Interface, either PXML or UCP. The factory default is PXML.

* = Factory Default

1 Not available if PNE Port is set to Serial.
**PNE Port Number**

This menu selects the port number the printer expects the PNE to connect through. The factory default is 3001 and the range is from 1025 to 65535.

**PNE Port Timeout**

If the PNE has not communicated to the printer within a timeout period, the PNE session closes. The factory default is 100 seconds. The range is from 1 to 255 seconds.

**Status Port Number**

This menu selects the port number the printer sends the emulation status. The factory default is 3001 and the range is from 1025 to 65535.

**Mgmt Port Number**

This menu selects the port number the printer expects the PXML or UCP to connect through. The factory default is 3007 and the range is from 1025 to 65535.
This chapter describes the host interfaces provided with the printer. The printer interface is the point where the data line from the host computer plugs into the printer. The interface processes all communications signals and data to and from the host computer. Plus, with the Auto Switching feature, you can configure the printer to accept several interfaces at the same time (see “Auto Switching Submenu” on page 86).

**IMPORTANT** To comply with Electromagnetic Compatibility (EMC) regulatory requirements all electrical signal interface cables connected to this printer must be of a minimal quality level, be of the correct length, and be properly installed.

The RS-232 port and parallel port interface cables must meet the following specifications:

- The cable design must be double shielded with a copper braid over an aluminum mylar foil and not just a conductive foil spiral wrapped around a drain wire.
- The shield must terminate coaxially (360 degrees) to a metal connector housing and not be terminated by just a simple wire lead.
- The cable length, including connectors, must be 3 meters or less.
- The cable connector anchor screws must be securely seated into the printer receptor hardware.

For reference purposes only, two specific Centronics parallel port cables that have been tested and found to comply with these requirements are Belkin® part number F2A046-10 and Primelogic® part number PLU 2823224. Other electrically equivalent cables are acceptable.

This chapter describes the interfaces provided with the printer.

**Standard Host Interfaces:**

- High Speed Serial Port (RS-232)
- USB 2.0 Universal Serial Bus
Optional Host Interfaces:

- Centronics Parallel
- IEEE 1284 parallel bidirectional
- Ethernet 10/100BaseT

In addition to descriptions for the multi-line interfaces, this chapter also provides instructions for configuration of terminating resistors for the parallel interfaces.

RS-232 Serial Interface

NOTE: The RS-232 serial interface circuit characteristics are compatible with the Electronic Industry Association Specifications EIA-232-E and EIA-422-B.

The RS-232 serial interface enables the printer to operate with bit serial devices that are compatible with an RS-232 controller. The input serial data transfer rate (in baud) is selectable from the printer's control panel. Baud rates of 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200 baud rates are available.

The length of the data cable from the host computer to the printer must not exceed 50 feet (15 meters) for RS-232.

#### Receive Data (RD)
Serial data stream to the printer.

#### Transmit Data (TD)
Serial data stream from the printer for transmitting status and control information to the host. Subject to protocol selection.

#### Request To Send (RTS)
Control signal from the printer. Subject to configuration.

#### Clear To Send (CTS)
Status signal to the printer indicating the host is ready to receive data/status signals from the printer.

#### Data Set Ready (DSR)
Status signal to the printer indicating the host is in a ready condition.

#### Data Carrier Detect (DCD)
Status signal to the printer. The ON condition is required for the printer to receive data.

#### Data Terminal Ready (DTR)
Control signal from the printer. Subject to configuration.

### USB

#### Menus
The Universal Serial Bus (USB) port is part of Auto Switching and is active when the Host Interface menu is set to Auto Switching. It can also be selected as the only Host Interface under the Host Interface menu by selecting USB.

A top level USB Port menu with two submenus is also available:

- **Buffer Size in K.** The input buffer size used by the USB port. The range is from 1 to 16. The default is 16.

- **Timeout.** The Hotport Timeout value used to determine when the port is inactive. The range is from 1 to 60 seconds. The default is 10 seconds.
The length of the data cable from the host computer to the printer must not exceed 15 feet (5 meters).

Centronics Parallel Interface Signals

Data Lines 1 through 8. Provides eight standard or inverted levels from the host that specify character data, plot data, or a control code. Data Line 8 allows access to the extended ASCII character set. You may enable or disable this line via the Data Bit 8 parameter on the Centronics submenu (see page 90).

Data Strobe. Carries a low true, 100 ns minimum pulse from the host that clocks data into the printer.

Acknowledgment. A low true pulse from the printer indicating the character or function code has been received and the printer is ready for the next data transfer.

Online. A high true level from the printer to indicate the printer is ready for data transfer and the ONLINE key on the control panel has been activated. When the printer is in online mode, it may accept data from the host.

Paper Empty (PE). A high true level from the printer to indicate the printer is in a paper empty or paper jam fault.

Busy. A high true level from the printer to indicate the printer cannot receive data.

Prime. A high true level from the host to indicate the printer should perform a warm start (printer is reset to the power-up configuration values).

Paper Instruction (PI). Carries a CVFU signal from the host with the same timing and polarity as the data line.

Fault. A low true level from the printer indicates a printer fault.
IEEE 1284 Parallel Interface

The 1284 supports three operating modes, which are determined by negotiation between the printer and the host.

Compatibility Mode

This mode provides compatibility with Centronics-like host I/O (see Table 15). Data is transferred from the host to the printer in 8-bit bytes over the data lines. Compatibility Mode can be combined with Nibble and Byte Modes to provide bidirectional communication.

Nibble Mode

Eight bits equals one byte. When a byte of data is sent to the printer, the eight bits are sent over eight data lines. Some devices cannot send data over their eight data lines. To bypass this, the 1284 permits data to be sent as half a byte over four status lines. (Half a byte equals one nibble.) Two sequential four-bit nibbles are sent over the lines. Data is transferred from printer to host in four-bit nibbles over the status lines, and the host controls the transmission.

Byte Mode

The printer and host send data to each other along eight data lines (one bit per line). If bidirectional communication is supported by the printer and the host, the host will take control of the data transfer.
Table 15 lists each of the signals associated with the corresponding pins on the 1284 interface. Descriptions of the signals follow.

</table>

**NOTE:** The length of the data cable from the host computer to the printer should not exceed 32 feet (10 meters).

**Host Clock / nWrite.** Driven by host. Data transferred from host to printer. When printer sends data, two types are available. If Nibble mode, signal is set high. If Byte mode, signal is set low.

**Data 1 through Data 8.** These pins are host-driven in Compatibility mode and bidirectional in Byte mode. They are not used in Nibble mode. Data 1 is the least significant bit; Data 8 is the most significant bit.

**Printer Clock / Peripheral Clock / Interrupt.** Driven by the printer. A signal from the printer indicating the character or function code has been received and the printer is ready for the next data transfer.

**Printer Busy / Peripheral Acknowledge / nWait.** Driven by the printer. Indicates the printer cannot receive data. (Data bits 4 and 8 in Nibble mode.)

**Acknowledge Data Request / nAcknowledge Reverse.** Driven by the printer. Indicates the printer is in a fault condition. (Data bits 3 and 7 in Nibble mode.)

**Xflag.** Driven by the printer. A high true level indicating the printer is ready for data transfer and the printer is on line. (Data bits 2 and 6 in Nibble mode.)

**Host Busy / Host Acknowledge / NDStrobe.** Driven by the host. Activates auto-line feed mode.

**Peripheral Logic High.** Driven by the printer. When the line is high, the printer indicates all of its signals are in a valid state. When the line is low, the printer indicates its power is off or its signals are in an invalid state.

**nReverse Request.** Driven by the host. Resets the interface and forces a return to Compatibility mode idle phase.
nData Available / nPeripheral Request. Driven by the printer. Indicates the printer has encountered an error. (Data bits 1 and 5 in Nibble mode.)

1284 Active / nAStrobe. Driven by the host. A peripheral device is selected.

Host Logic High—Driven by the host. When set to high, the host indicates all of its signals are in a valid state. When set to low, the host indicates its power is off or its signals are in an invalid state.

nInit —Resets init interface from the host.

**Ethernet**

Refer to the *Integrated Network Interface User’s Manual* for detailed information on the ethernet interface.
Reprogramming the Security Key

The security key on the PSA3 controller board can be reprogrammed with a Software Program Exchange (SPX) module. The SPX is an intelligent module that plugs into the debug port on the back of the P8000. The SPX is used only once; it automatically overwrites itself after successfully reprogramming a security key. This allows the end user or a service technician to enable features such as new emulations without having to remove covers and install a new security key on the controller board.

The SPX is used at power-up only and is not left in the printer during normal operation. Because it is a single-use disposable item the user is not required to return it to the vendor or manufacturer.

How to Program the Security Key

1. Power off the printer.
2. On cabinet models, open the rear door. On pedestal models, refer to Figure 24 to locate the debug port at the rear of the printer.
3. Insert the SPX into the debug port as shown.
4. Power on the printer. The printer will begin its boot-up sequence.

5. When the printer detects a valid SPX, the control panel displays: “NEW SPX DETECTED PRESS ENTER”

**NOTE:** If an error message displays, find the message in the Message List in Chapter 7 and follow the troubleshooting instructions.

6. Press the **ENTER** key to activate the reprogramming sequence. The display will read: “PROGRAMMING. PLEASE WAIT.”

7. When the security key is reprogrammed, the display will read: “REMOVE USED SPX THEN PRESS ENTER”

8. Remove the SPX from the debug port at the rear of the printer.

9. Press the **ENTER** key. The printer will reboot itself and you may resume normal printing.

10. You may need to download a new program file to use the new feature.

11. You may need to set additional menu parameters for any new features that have been added or enabled.
Cleaning Requirements

Clean the printer every six months or after every 1000 hours of operation, whichever occurs first. If the printer is located in a dusty area or is used for heavy duty printing, clean it more often.

**WARNING**  Disconnect the power source before cleaning the printer.  
Vor dem Säubern des Druckers ist die Netzverbindung zu unterbrechen.  
Débranchez l’alimentation avant de nettoyer l’imprimante.  
Desconecte la fuente de energía antes de limpiar la impresora.  
Staccare la fonte di energia prima della pulitura della stampante.

**Exterior Cleaning**

Clean the outside of the cabinet with a soft, lint-free cloth and mild detergent soap. (Dishwashing liquid works well.) Do not use abrasive powders or chemical solvents. Clean the windows with plain water or mild window cleaner. Always apply the cleaning solution to the cloth; never pour cleaning solution directly onto the printer.
Interior Cleaning

Over time, particles of paper and ink accumulate inside the printer. This is normal. Paper dust and ink build-up must be periodically removed to avoid degraded print quality. Most paper dust accumulates around the ends of the platen and ribbon path.

Figure 25. Interior Printer Components
To clean the interior of the printer perform the following steps.

1. Power off the printer and unplug the printer power cord.
2. Open the printer cover.
3. Fully raise the platen lever.
4. Unload the paper.
5. Remove the ribbon cartridge.
6. Lift the ribbon out of the ribbon path.
7. Brush the paper dust and ribbon lint off the tractors, shuttle cover assembly, and base casting with a soft-bristled, non-metallic brush (such as a toothbrush). Vacuum up the residue.

**CAUTION** Vacuum carefully around the hammer bank and surrounding area to avoid damage. To avoid corrosion damage, use only alcohol when cleaning the printer mechanical elements. Solutions used to clean mechanical elements must contain no water.

8. Wipe the splined shaft with a soft cloth.
9. Check the ribbon mask and hammer bank cover for bits of torn paper or ribbon lint.
10. Remove dust and ink from the platen using a soft cloth lightly moistened with anhydrous alcohol. (The platen is the thick silver bar behind the hammer bank cover that rotates when the platen lever is rotated.)

**CAUTION** When cleaning the platen, be very careful not to get any alcohol in the hammer bank, because alcohol will cause severe damage to the hammer bank. Only a trained service technician should clean the shuttle assembly.

11. Brush and vacuum the accumulated dust or residue inside the lower cabinet.
12. Wipe the lower cabinet interior with a clean, lint-free cloth dampened (not wet) with water and mild detergent or window cleaning solution. Dry the lower cabinet interior by wiping it down with a clean, lint-free cloth.
13. Install the ribbon and load paper.
Diagnosing Problems

This section is designed to help you fix problems which may arise with normal printer operation.

Bar Code Verification

The most important consideration when printing a bar code is to ensure that the bar code will be scanned properly. Incorporating a bar code quality procedure in the printing process is the best way to ensure that bar codes are being printed correctly. A properly implemented verification procedure will increase overall bar code quality, reduce waste from misprinted bar codes, and achieve high first-time read rates. A high first-time read rate is an increasingly important factor in newer, more efficient systems where manually entered data is not acceptable as a backup function. Verification also minimizes the costs of returned products due to poor reading or unaccountable bar codes.
A hex code printout (or hex dump) is a translation of all host interface data to its hexadecimal equivalent, listing all ASCII character data received from the host computer with their corresponding two-digit hexadecimal codes. Hex dumps are used to troubleshoot printer data reception problems.

Printable characters print as the assigned symbol; nonprintable characters are indicated by a period (.).

Figure 26 shows an example of a hex dump.
The CD contains a utility called hexcode.exe. This utility can be run from a DOS window to convert an input file into a hexadecimal equivalent. The output from this utility can then be used to compare what is received when printing a hex dump.

Usage: **hexcode** *<input file>* *<output file>*

Sample output:

```
412068657820636F646572732061207061797320617573207468652061206865616666697920736166657373756C73
```

248
Diagnostics for EXX, BAD NVM, or ILL NVM Errors

If the printer displays LCD error messages such as ‘E03E DSI CXIWX”, “BAD NVM”, or “ILL NVM”, reboot the printer (turn power on and off) and continue. If the problem persists, then invoke a diagnostic option that will capture the failure dump in a flash file that can be later uploaded from PrintNet Enterprise Suite and sent to Printronix Customer Support Center for analysis (see Appendix D, page 301).

This diagnostic option must be enabled for the printer to capture the information. If you choose to perform this diagnostic perform the following procedure:

1. Within the DIAGNOSTICS section, set the Auto Dump menu to Enable.
2. When the failure happens, reboot the printer and wait for it to power up again.
3. Within the ADVANCED USER section, go to the Main File System submenu and then to View File List.
4. Verify that files ‘autodmp1’ or ‘autodmp2’ are present in the file list.
5. If present, use PrintNet Enterprise Suite to upload these files to your host computer.
6. Contact Printronix Customer Support Center and send them the files along with the printer’s configuration printout. Refer to the PrintNet Enterprise Suite User’s Manual on how to accomplish these tasks.

Fault Messages (ASCII in Alphabetical Order)

If a fault condition occurs in the printer, the status indicator on the control panel flashes on and off, and the message display indicates the specific fault. Fault messages are summarized in alphabetical order in Table 16. These error messages are used in ASCII products.

Displayed faults fall into one of two categories:

- Operator correctable
- Field service required

For the operator-correctable faults, follow the suggested solution in Table 16. After correcting the displayed fault, press the CANCEL key to clear the error message and status indicator and resume printing. If the fault message reappears, contact your authorized service representative.

NOTE: The Maintenance Manual provides more detailed information and procedures for resolving fault conditions. However, many of the procedures described there must be performed only by your authorized service representative.
Fault Messages Requiring Field Service Attention

If a fault is not correctable by the operator, the fault message is followed by an asterisk (*). This usually indicates that an authorized service representative is needed. You may try two steps to clear the fault before calling your authorized service representative:

1. Set the printer power switch to O (Off), wait 15 seconds, then turn the printer on again. Run your print job again. If the message does not appear, it was a false indication and no further attention is required.

2. If the message reappears, press the CANCEL key. If the message disappears, it was a false indication and no further attention is required. If the message reappears, call your authorized service representative.

1 Before contacting an authorized service representative, power off the printer, wait 15 seconds, then power it back on and rerun your print job. If the message reappears, press CLEAR. If the fault message still displays, then contact your authorized service representative.
Fault Messages (H-Series with Numerical Prefix)

If a fault condition occurs in the printer, the status indicator on the control panel flashes on and off, and the message display indicates the specific fault. Fault messages are summarized in Table 17. Many of the error messages for H-Series have a numerical prefix to help the user find the description within this manual.

Displayed faults fall into one of two categories:

- Operator correctable
- Field service required

For the operator correctable faults, follow the suggested solution in Table 17. After correcting the displayed fault, press the **CLEAR** key to clear the error message and status indicator, and resume printing. If the fault message reappears, contact your authorized service representative.

**NOTE:** The Maintenance Manual provides more detailed information and procedures for resolving fault conditions. However, many of the procedures described there must be performed only by your authorized service representative.

*Fault Messages Requiring Field Service Attention*

If a fault is not correctable by the operator, the fault message is followed by an asterisk (*). This usually indicates that an authorized service representative is needed. You may try two steps to clear the fault before calling your authorized service representative:

1. Set the printer power switch to O (Off), wait 15 seconds, then turn the printer on again. Run your print job again. If the message does not appear, it was a false indication and no further attention is required.

2. If the message reappears, press the **CLEAR** key. If the message disappears, it was a false indication and no further attention is required. If the message reappears, call your authorized service representative.

Paper Specifications

Type: Edge-perforated, fan-fold, 3 to 17 inches (7.62 to 43.18 cm) wide, 2 to 12 inches (5.08 to 30.48 cm) long.

SureStak Power Stacker option works with forms 5 to 12 inches (12.7 to 30.48 cm) long and up to 16 inches (41 cm) wide without the paper tent or 15.5 inches (39.5 cm) wide with the paper tent installed.

Thickness: Single-part: 15 to 100 pound (6.80 to 45.36 kg) stock;
Multi-part: 1- to 6-part forms (maximum 12 lb [5.44 kg] ply of upper plies)

Sheet Thickness: 0.025 inch (0.064 cm) maximum

Drive: Adjustable tractors (6-pin engagement)

Labels

On Backing: One-part continuous perforated fanfold back form. Labels must be placed at least 1/6 inch (0.42 cm) from the fan-fold perforation. Backing adhesive must not be squeezed out during printing.

Sheet Size: 3 to 17 inches (7.62 to 43.18 cm) wide, including the two standard perforated tractor feed strips. A maximum sheet length of 16 inches (40.64 cm) between top and bottom perforations.

NOTE: A 16 inch rear door is needed for the cabinet model. Power Paper Stacker option is 5 to 12 inches (12.7 to 30.48 cm) long.

Thickness: Not to exceed 0.025 inch (0.064 cm) (including backing sheet)

</thead>
</table>
Printing Speed

The printing speed of text is measured in lines per minute (lpm) and is a function of the selected font and the vertical dot density. Printing speed is independent of the number of characters configured in the character set repertoire. Print rates for lines containing attributes such as bold or emphasized printing, superscripts, subscripts, or elongated attributes will decrease to not less than half the rates of the font without such attributes. The exact print rate of lines containing these attributes depends on the specific print job, but software maximizes the throughput by dynamically determining which dot rows contain adjacent dots and must be printed in two strokes.

The reverse paper feed capability allows the printing of multiple densities on a single line. This is useful in printing forms and text together or in mixing different fonts on a print line. Use of multiple densities and reverse paper feed also affects throughput.

### ASCII Character Set Explanation

- **NULL**: Represents the null character, with no specific meaning or function.
- **DC1 (XON)**: Used to signal a data terminal ready signal.
- **SO**: Start of Text, used to signify the start of a text message.
- **HT**: Horizontal Tab, used to advance the cursor to the next tab stop.
- **BS**: Backspace, used to delete the character to the left of the cursor.
- **EM**: End of Medium, used to mark the end of a medium.
- **SUB**: Subscript, used to indicate that the following character is a subscript.
- **ESC**: Escape, used to initiate a control function.
- **FS**: Form Feed, used to advance the cursor to the next page.
- **GS**: Group Start, used to mark the start of a group.
- **US**: Underline Space, used to indicate that the following character is an underline space.

### ASCII Character Set Unicode Codes

- @ (64): Dollar sign
- ^ (7E): Exclam point
- _ (95): Underscore
- ~ (7E): Tilde
- \ (5C): Backslash

SureStak™ Power Stacker

Introduction

The SureStak Power Stacker is a factory-installed option that augments the paper feed system of cabinet model printers. It is designed to work with forms 5 to 12 inches long (12.7 to 30.5 cm) and up to 16 inches (41 cm) wide without the paper tent installed or up to 15.5 inches (39.5 cm) wide with the paper tent installed. (See Figure 27.) Using longer or shorter paper can cause error messages and unpredictable operation of the stacker.

Because most of the stacker assembly is inside the cabinet, you must remove the stacker from the printer to service it or replace most of its components.

Stacker Operation

The power stacker mechanically directs the paper from the printer to the paper stack. It is mounted in the rear of the cabinet and has its own control panel. Its main components are shown in Figure 27.

![Figure 27. Power Stacker Component Locations](image-url)
Setting Up the Power Stacker

1. Set the printer power switch to I (On).

2. If necessary, press the ONLINE key on the front panel or rear control panel to take the printer offline. (Figure 28.)

3. Press the ELEVATOR UP key and wait for the elevator assembly to reach the top of its travel. (Figure 28.)

Figure 28. The Rear Control Panel
4. If the paper you will use is not wider than 15.5 inches (39.5 cm) pull out the paper tray and install the wireform paper tent. (Figure 29.) If the paper is wider than 15.5 inches (39.5 cm) leave the paper tent out of the printer.

Figure 29. The Paper Tent
5. Push or pull the paddle shaft toward the front or the rear of the printer to set the desired paper length. Align the indicator notch on the bearing bracket with the paper length indicator. The power stacker can handle paper or forms from 5 to 12 inches (12.7 to 30.5 cm) long. (Figure 30.)

Figure 30. The Paper Length Indicator
Loading and Starting the Power Stacker

1. Press the PAPER ADVANCE key and hand feed the paper down into the paper throat of the stacker. Continue to advance the paper until it reaches the paper tent (if installed) and feed three to five extra sheets into the stacker. Make sure the paper passes through the paper throat of the stacker. (Figure 31.)

2. Stack the extra pages on top of the wire paper tent (if installed), making sure the paper bends with the natural fold. (Figure 31.)

3. Press the ONLINE key to put the printer in the online state. The stacker elevator will return to the correct position for printing.

4. Check that the paper is still centered between the sides of the paper tent (if installed).

5. Close the cabinet rear door.

6. If necessary, set Top Of Form.

Figure 31. Stacking Paper on the Wire Paper Tent
Printronix Customer Support Center

**IMPORTANT** Please have the following information available prior to calling the Printronix Customer Support Center:

- Model number
- Serial number (located on the back of the printer)
- Installed options (i.e., interface and host type if applicable to the problem)
- Configuration printout:
  Press **CONFIG** on the control panel, then press the **ENTER (↵)** key.
- Is the problem with a new install or an existing printer?
- Description of the problem (be specific)
- Good and bad samples that clearly show the problem (faxing or emailing these samples may be required)

Printronix encourages owners of information technology (IT) equipment to responsibly recycle their equipment when it is no longer needed. Printronix offers a variety of programs and services to assist equipment owners in recycling their IT products. Information on these product recycling offerings can be found on Printronix’s Internet site at http://www.printronix.com.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

For online versions of this book, we authorize you to:

- Copy, modify, and print the documentation contained on the media, for use within your enterprise, provided you reproduce the copyright notice, all warning statements, and other required statements on each copy or partial copy.

- Transfer the original unaltered copy of the documentation when you transfer the related Printronix product (which may be either machines you own, or programs, if the program’s license terms permit a transfer). You must, at the same time, destroy all other copies of the documentation.

You are responsible for payment of any taxes, including personal property taxes, resulting from this authorization.

Your failure to comply with the terms above terminates this authorization. Upon termination, you must destroy your machine readable documentation.
Energy Star

ENERGY STAR is a joint program of the U.S. Environmental Protection Agency and the U.S. Department of Energy with the goal of protecting the environment by using energy efficient products.

Printronix participates in the Energy Star program for Imaging Equipment by introducing printers that reduce power consumption when they are not being used. Prior to 2012, Printronix certified products under the self-certification program. In accordance with the latest requirements, Printronix now employs approved third party test labs to certify that their product comply with the latest Energy Star standards.

NOTE: The ENERGY STAR® emblem does not represent EPA endorsement of any product or service. More information about the Energy Star program can be found at http://www.energystar.gov.
Communication Statements

Federal Communications Commission (FCC) Statement

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Printronix is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user’s authority to operate the equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

European Union (EU) Conformity Statement

Hereby, Printronix declares that this product is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

Printronix cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-Printronix option cards.

This product has been tested and found to comply with the limits for Class A Information Technology Equipment according to European standard EN 55022. The limits for Class A equipment were derived for commercial and industrial environments to provide reasonable protection against interference with licensed communication devices.

WARNING
This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.
Properly shielded and grounded cables and connectors must be used in order to reduce the potential for causing interference to radio and TV communications and to other electrical or electronic equipment. Printronix cannot accept responsibility for any interference caused by using other than recommended cables and connectors.

**Industry Canada Compliance Statement**

This Class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A conform á la norme NMB-003 du Canada.

**Statement of CISPR 22 Compliance**

**Attention:** This is a Class A Product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

**Japanese VCCI Class A**

この装置は、情報処理装置等電波障害自主規制協議会（V C C I）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

**German Conformity Statement**

**Handbuchtexte: FCC class A entspricht: EMVG Klasse A**

Text Für alle in Deutschland vertriebenen EN 55022 Klasse A Geräte:

Dieses Gerät ist berechtigt in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen. Verantwortlich für die Konformitätserklärung nach Paragraph 5 des EMVG ist die:

Printronix GmbH
Goethering 56
D-63067 Offenbach Germany

Informationen in Hinsicht EMVG Paragraph 4 Abs. (1) 4:

Das Gerät erfüllt die Schutzanforderungen nach EN 55024 und EN 55022 Klasse A.

EN 55024 Hinweis:
Wird dieses Gerät in einer industriellen Umgebung betrieben (wie in EN 55024 festgelegt), dann kann es dabei eventuell gestört werden. In solch einem Fall ist der Abstand bzw. die Abschirmung zu der industriellen Störquelle zu öergrvßern.

Anmerkung:
Um die Einhaltung des EMVG sicherzustellen sind die Geräte, wie in den Printronix Handbüchern angegeben, zu installieren und zu betreiben.

China
Declaration:
This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may need to perform practical actions.

此为A级产品。在生活环境中，该产品可能会造成无线电干扰。在这种情况下，可能需要用户对其干扰采取切实可行的措施。

Altitude and Non-Tropical Climate Statement

仅适用于海拔 2000m 一下地区安全使用

仅适用于非热带气候条件下安全使用
Taiwan

Warning:
This is a Class A product. In a domestic environment this product may cause radio interference in which case the user will be required to take adequate measures.

警告使用者：
這是甲類的資訊產品，在居住的環境中使用時，可能會造成射頻干擾，在這種情況下，使用者會被要求採取某些適當的對策。

Korea

A급 기기(업무용)
이 기기는 업무용으로 전자파적합등록을 받은 기기이오니 판매자 또는 사용자는 이 점을 주의하시기 바라며, 만약 구입하였을 때에는 구입한 곳에서 가정용으로 교환하시기 바랍니다.

CAUTION:
This product is equipped with a 3-wire power cord and plug for the user’s safety. Use this power cord in conjunction with a properly grounded electrical outlet to avoid electrical shock.
Software License Agreement

Your printer contains, among other software, Printronix operating software including, but not limited to the Embedded Configurable Operating System (the “eCos Software”) as embedded software. The terms of this Agreement apply only to the eCos Software, and all other embedded software supplied with the printer. You accept the terms of this Agreement by your initial use of your printer.

eCos License

This file is part of eCos, the Embedded Configurable Operating System.

eCos is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 or (at your option) any later version.

You should have received a copy of the GNU General Public License along with eCos; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA.

eCos is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

As a special exception, if other files instantiate templates or use macros or inline functions from this file, or you compile this file and link it with other works to produce a work based on this file, this file does not by itself cause the resulting work to be covered by the GNU General Public License. However the source code for this file must still be made available in accordance with section (3) of the GNU General Public License.

This exception does not invalidate any other reasons why a work based on this file might be covered by the GNU General Public License.

Alternative licenses for eCos may be arranged by contacting Red Hat, Inc. at http://sources.redhat.com/ecos/ecos-license/
GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputation.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.
The precise terms and conditions for copying, distribution, and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION, AND MODIFICATION

This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification"). Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program’s source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a. You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

   b. You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

   c. If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)
These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a. Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b. Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c. Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
Appendix E Software License Agreement

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.
8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING,
REPAIR OR CORRECTION

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.
