1 Power Camera

Plug the camera into a wall outlet using the included power adapter and USB cable.

The status LED lights up in purple when you first power up the camera. Once the camera has booted up, the status LED turns blue indicating the camera is ready to scan the QR code on your smartphone.

2 Set up SwannOne Account

Creating a SwannOne Account

Before you can register and view the camera, you will need to create a SwannOne account. Your SwannOne account is what you use to control and manage all your SwannOne devices and services from anywhere.

Go to **home.swannone.com** using your web browser, and sign up for a SwannOne account.

Downloading the SwannOne App

Once your SwannOne account is created, download the SwannOne App for iOS or Android on your smartphone or tablet from the Apple App Store or Google Play.

3 Register Camera

Now that you have your SwannOne account and app ready, let's get the camera connected to the internet via your Wi-Fi network with your smartphone so it can be added to your account.

Before starting, make sure your smartphone is connected to a 2.4GHz 802.11 b/g/n Wi-Fi network. The camera is not compatible with the 5GHz network band.

1. Launch the  SwannOne App on your smartphone and sign in. The app should automatically load the QR code generator screen for you to enter the password for your wireless network. You can also bring up this screen at any time by touching  > QR Code.
2. Enter your wireless network password (case-sensitive) and then touch **Continue**. The app generates a QR code (containing your wireless network details) that you can scan with the camera.
3. Scan the QR code with the camera. The camera status light will blink green twice when you scan the QR code successfully. You'll know your camera is connected to the Internet once the status light starts blinking purple.
4. To complete setup, go to **home.swannone.com**, sign in and add the camera to your account using the camera MAC ID.

Top Tips

- The camera packaging box comes with a camera holder and smartphone placement markings to help you scan the QR code easily. Simply position your camera and smartphone as shown on the right.

- Keep excess USB cable tidy by removing the base of the camera dock and threading the cable along the channels on the inner side of the base. Replace the base once cable is neatly routed.
- You can reset the camera to factory settings by pressing and holding the **Reset** button until the camera status LED turns off. Wait for the camera status LED to turn blue before scanning the QR code.
